Create or select a host

The template you selected (Veeam Backup Enterprise Manager by HTTP) must be linked to a host - an entity in Zabbix that represents your monitoring target.

Hosts are organized into host groups for easier management and access control.

Overview

It works without any external scripts and uses the script item.

NOTE: This template uses the Veeam Backup Enterprise Manager REST API.

Veeam Backup Enterprise Manager must be installed and licensed.

Supported editions include:

- VUL Foundation
- VUL Advanced
- VUL Premium
- Enterprise
- Enterprise Plus

Community Edition and Backup Starter do not provide Enterprise Manager functionality and are not supported by this template.

NOTE: Veeam Backup & Replication v13 also provides a native REST API on port 9419, separate from the Enterprise Manager REST API used by this template.

A different Veeam Backup and Replication by HTTP template is required for monitoring the native VBR REST API.

See [Veeam Data Platform Feature Comparison](#) for more details.

Setup

See [Zabbix template operation](#) for basic instructions.

1. Create a user to monitor the service, or use an existing read-only account. Similarly to the user authentication in the Veeam Backup Enterprise Manager Web UI, the client authentication in the REST API dictates which operations a client is allowed to perform when working with the REST API. That is, if the client is authenticated using an account that does not have enough permissions to perform some actions, it will not be able to execute them. You can obtain collected jobs even if logged in with only the `Portal Administrator` role.

See [Veeam Help Center](#) for more details.

2. Link the template to a host.
3. Configure the following host wizard configuration fields: Address, Username, and Password.

Select a template:

Veeam Backup Enterprise Manager by HTTP

Create or select a host:

Veeam Backup Enterprise Manager (new)

Configure host

Configure host (2/2)

To complete the setup, configure the following variables (host macros).

* Address

* Password

* Username

Macro: {\$VEEAM.MANAGER.API.URL}

Veeam Backup Enterprise Manager API endpoint is a URL in the format:

<scheme>://<host>:<port>.

Macro: {\$VEEAM.MANAGER.PASSWORD}

The password of the Veeam Backup Enterprise Manager account.

Macro: {\$VEEAM.MANAGER.USER}

The user name of the Veeam Backup Enterprise Manager account.
