

WHAT'S NEW IN VEEAM MANAGEMENT PACK 4.5

The nworks Management Pack 4.5 is an update to Veeam's leading-edge management integration for distributed monitoring and management of the VMware Infrastructure using Microsoft System Center Operations Manager 2007, or Microsoft Operations Manager 2005.

Responding to customer feedback and continuing to work closely with VMware, version 4.5 includes the following enhancements:

Scalability and Performance

Veeam developers, working closely with VMware, enhanced Collector version 4.5 to support larger VMware environments and reduce vCenter processing requirements. One collector now supports twice as many ESX hosts & virtual machines, you now monitor more ESX hosts and more VMs with less impact on your vCenter server.

Ease of Management and Deployment

Fewer collectors equates to simpler designs and higher reliability, simplifying your deployment and ongoing operational requirements. This is matched with enhancements on the MP side, including real-time updates to the Topology diagrams and state views, leveraging new Monitors for critical vCenter events.

The Management Pack has been qualified through the VMware Ready testing process and is certified as VMware Ready Optimized. This designation provides you the assurance that the Management Pack is optimized for VMware Infrastructure, as well as the next-generation VMware vCloud, and you benefit knowing the deployment is safe, lowering integration costs for your VMware environment.

Focus on Your Business

Version 4.5 takes advantage of vCenter custom attributes providing you the ability to segment your environment by line of business, SLA terms or other custom grouping. Treat VMs depending on how critical they are in terms of your business, and divide your data center into collections of your own choosing building Dashboards, Views and Reports accordingly.
