

2023 Data Protection Trends

In late 2022, an independent research firm completed their survey of **4,200** unbiased IT leaders and implementers on a variety of data protection drivers, challenges, and strategies — including **645** in Latin America. The following are some key statistics as reported by respondents affecting the data protection in Latin America.

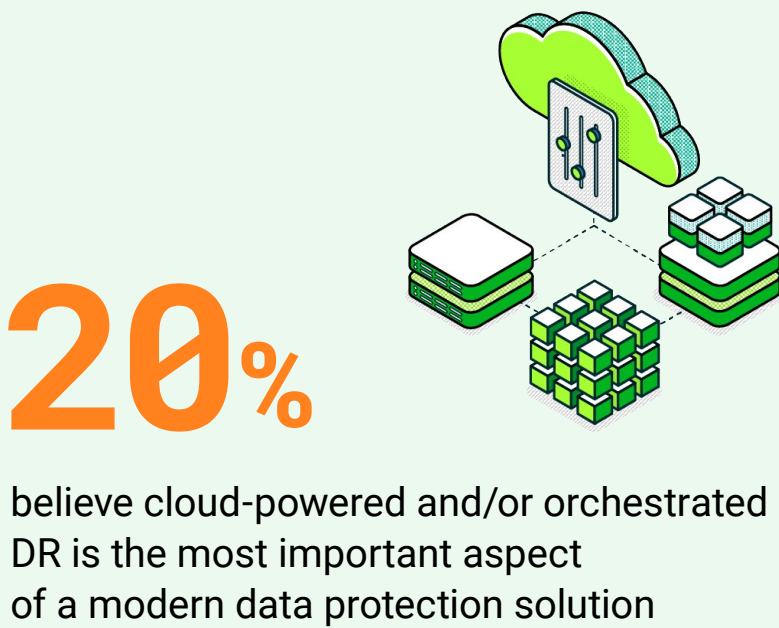

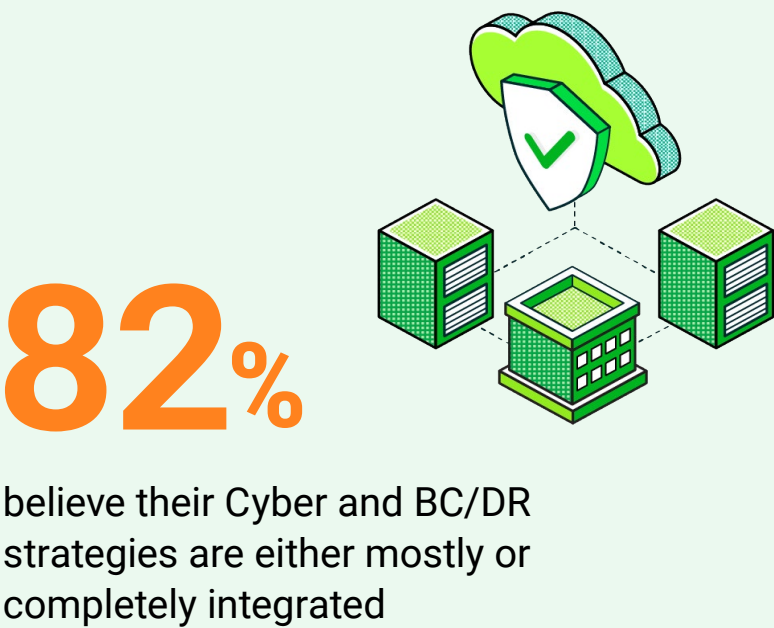

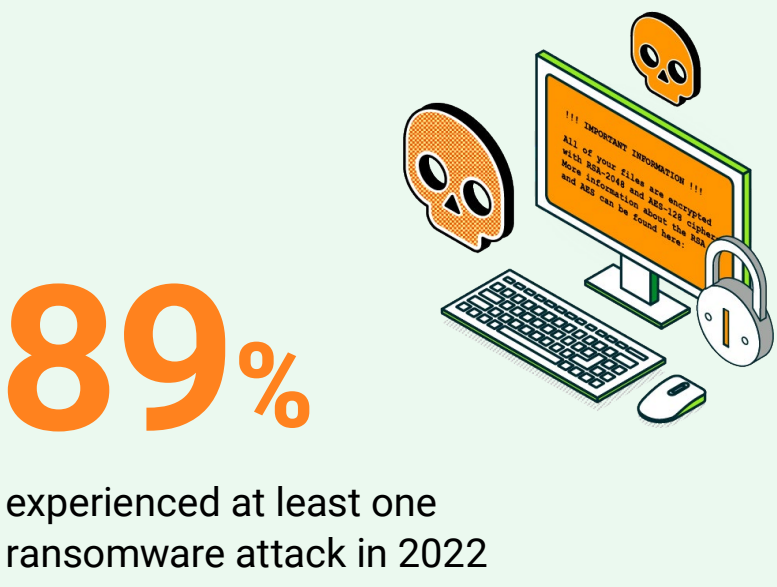

There is expected to be a significant shift with incremental investment in data protection for 2023

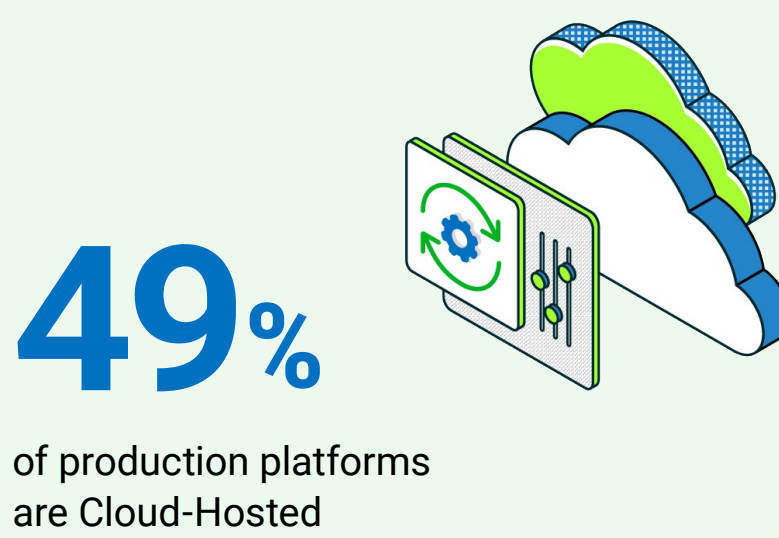

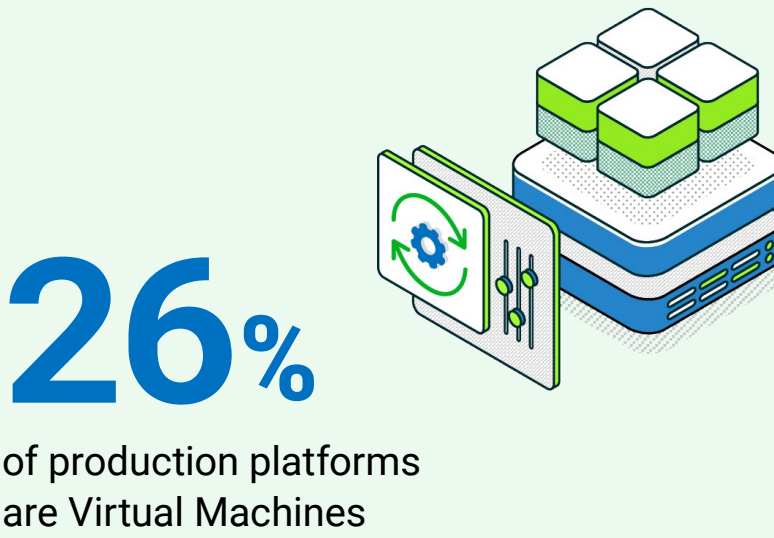

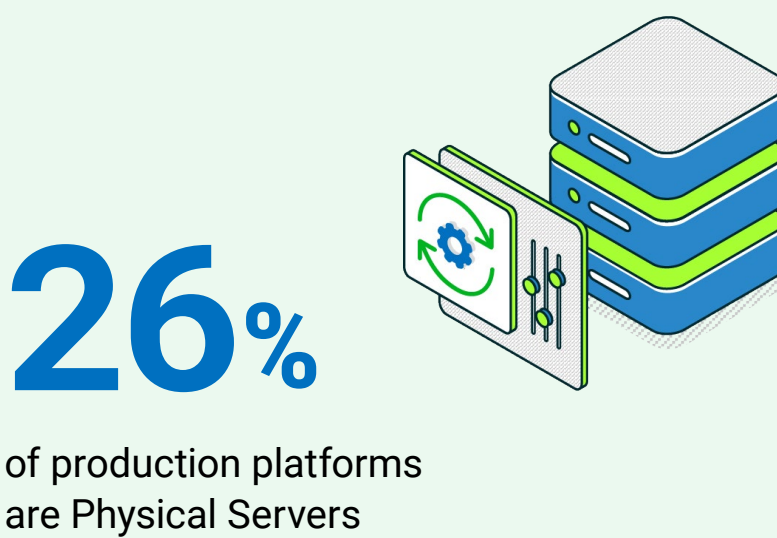

The primary drivers for change are seeking higher reliability and improved recoverability, in part due to the dissatisfaction with their existing data protection strategies

Ransomware and other BC/DR events continue to be top of mind as organizations prepare for 2023

Perhaps the most challenging 2023 trend affecting data protection strategy is the breadth of Hybrid IT by organizations of all sizes

Increased usage of the cloud in both production and protection are also key drivers in 2023
