Contacting Veeam Software

At Veeam Software we value feedback from our customers. It is important not only to help you quickly with your technical issues, but it is our mission to listen to your input and build products that incorporate your suggestions.

Customer Support

Should you have a technical concern, suggestion or question, visit the Veeam Customer Support Portal at www.veeam.com/support.html to open a case, search our knowledge base, reference documentation, manage your license or obtain the latest product release.

Company Contacts

For the most up-to-date information about company contacts and offices location, visit www.veeam.com/contacts.html.

Online Support

If you have any questions about Veeam products, you can use the following resources:

- Full documentation set: www.veeam.com/documentation-guides-datasheets.html
- Veeam R&D Forums at forums.veeam.com
About This Document

This user guide provides information about Veeam Agent for Linux.

Intended Audience

The user guide is intended for anyone who wants to use Veeam Agent for Linux 5.0 to protect their machine.
Overview

Veeam Agent for Linux is a data protection and disaster recovery solution for physical endpoints and virtual machines running Linux-based operating systems.

Veeam Agent can be used by IT administrators who run Linux infrastructure to protect different types of computers and devices: servers, desktops and laptops. The solution runs inside the guest OS and does not need access to virtualization infrastructure components. Thus, Veeam Agent can be used to protect Linux server instances deployed in the public cloud, for example, in Microsoft Azure environment.

**NOTE:**

Veeam Agent can operate in either standalone or managed mode. Depending on the mode, Veeam Agent provides different features and limitations. To learn more, see Standalone and Managed Operation Modes.

Veeam Agent offers a variety of features to protect your data. You can create an entire system image backup, back up specific machine volumes or individual directories and files. Backups can be stored on a local hard drive, on an external hard drive, in a network shared folder or on a Veeam backup repository.

In case of a disaster, you can perform the following restore operations:

- Start the OS from the Veeam Recovery Media and use standard Linux command line tools to diagnose and fix problems.
- Perform bare-metal restore.
- Restore necessary data from backups to its original location or a new location.

Veeam Agent integrates with Veeam Backup & Replication. Backup administrators who work with Veeam Backup & Replication can perform advanced tasks with Veeam Agent backups: restore files and disks from backups, manage backup jobs configured in Veeam Agent or backups created with these jobs.
Solution Architecture

Veeam Agent for Linux is set up on a Linux-based physical endpoint or virtual machine whose data you want to protect.

When you install the product, Veeam Agent deploys the following components:

- **Veeam Agent for Linux Service (veeamservice)** is a service responsible for managing all tasks and resources in Veeam Agent. The veeamservice component is registered as a daemon in the Linux OS upon the product installation. The service is started automatically when you start the OS, and runs in the background.

- **Veeam Agent for Linux Job Manager (veeamjobman)** is a process started by Veeam Agent for Linux Service for every backup job session.

- **Veeam Agent** that communicates with the Veeam Agent for Linux Service and Veeam Agent for Linux Job Manager. Veeam Agent is started by Veeam Agent for Linux Manager to perform data transfer operations of any kind: copy data from the backed-up volume to the backup location during backup, from the backup location to the target volume during restore, perform data compression, and so on.

- **Veeam Agent for Linux Driver (veeamsnap)** is a Veeam driver (Linux kernel module) used to create volume snapshots in the Linux OS and keep track of changed data blocks.

- To store its configuration data, Veeam Agent uses the SQLite database engine. SQLite requires only few files to install and takes little resources to run on a Linux OS.
Veeam Agent for Linux can operate in two modes: standalone mode and managed mode.

- **Standalone mode** — in this mode, Veeam Agent for Linux operates as a standalone product. To use Veeam Agent operating in the standalone mode, you must manually install the product directly on the machine whose data you want to protect.

  For Veeam Agent for Linux operating in the standalone mode, data protection, disaster recovery, and administration tasks are performed in Veeam Agent by a user. You can also use Veeam Agent operating in the standalone mode with Veeam Backup & Replication. In this scenario, you can use a Veeam backup repository as a target location for Veeam Agent backups and use the Veeam Backup & Replication console to perform a number of tasks with Veeam Agent backup jobs and backups.

  The current User Guide covers subjects related to Veeam Agent for Linux operating in the standalone mode only.

- **Managed mode** — in this mode, Veeam Agent for Linux operates under control from Veeam Backup & Replication. To use Veeam Agent operating in the managed mode, you must deploy the product remotely from Veeam Backup & Replication.

  For Veeam Agent for Linux operating in the managed mode, product deployment, data protection, disaster recovery, and administration tasks are performed by a backup administrator in the Veeam Backup & Replication console.

  Features and limitations of Veeam Agent for Linux operating in the managed mode are different from those in the standalone mode. To learn about Veeam Agent operating in the managed mode, see the Veeam Agent Management Guide.
Data Backup

It is recommended that you regularly back up data stored on your machine. Backup creates a safety copy of your data. If any kind of disaster strikes, you can restore your data from the backup and be sure that you will not lose the necessary information.

You can set up Veeam Agent to perform automatic scheduled backups (triggered at specific time of the day), or you can choose to back up data manually when needed. You can back up the entire computer image, specific computer volumes or individual directories and files.

You can set up Veeam Agent to create multiple backups — with individual backup scope, upon individual schedule or in different locations. This functionality is available if Veeam Agent operates in the Server edition. To learn more about editions, see Product Editions.

Backups created with Veeam Agent can be saved to the following locations:

- Removable storage device
- Local computer drive
- NFS or SMB (CIFS) network shared folder
- Backup repository managed by a Veeam backup server
- Veeam Cloud Connect repository
Backup Types

Veeam Agent for Linux lets you create the following backup types:

- Volume-level backup
- File-level backup

Volume-Level Backup

You can set up Veeam Agent for Linux to create volume-level backup. The volume-level backup captures the whole image of a data volume on your computer. You can use the volume-level backup to restore a computer volume, specific files and folders on the volume or perform bare-metal recovery.

Veeam Agent for Linux supports backup of the following types of computer volumes:

- Simple volumes
- LVM logical volumes
- Btrfs subvolumes

You can back up all computer volumes or specific computer volumes.

- When you back up the entire computer image, Veeam Agent captures the content of all volumes on your computer. The resulting backup file contains all volume data and Linux OS system data: system partition, partition table and bootloader.
• When you back up a specific computer volume, Veeam Agent captures only the data that resides on this specific volume: files, folder, application data and so on.

If you choose to back up the system volume (volume to which the root file system is mounted), Veeam Agent automatically includes the bootloader into the backup scope.

File-Level Backup

You can set up Veeam Agent for Linux to create file-level backup. The file-level backup captures only data of individual directories and files on the computer. You can use the file-level backup to restore files and directories that you have added to the backup scope.

With Veeam Agent for Linux, you can specify which files and directories to back up:

• You can include individual directories in the backup. When you include a directory in the backup, its subdirectories are automatically included in the backup too. When you recover from such backup, you will be able to restore directories that you have selected to back up, all subdirectories of these directories and files in these directories.
• You can exclude from the backup some subdirectories of the directories that are included in the backup. When you recover from such backup, you will be able to restore directories that you have selected to back up, specific subdirectories of these directories and files in these directories.

• You can include or exclude files of a specific type in/from the backup. You can specify file names explicitly or use UNIX wildcard characters to define include and exclude file name masks. When you recover from such backup, you will be able to restore directories that you have selected to back up with files whose names match the specified include masks.

Limitations for File-Level Backup

Veeam Agent for Linux does not back up extended attributes of backed-up files and directories during file-level backup.
Snapshot-Less File-Level Backup

You can set up Veeam Agent for Linux to create file-level backup in the snapshot-less mode. This allows you to back up data that resides in any file system mounted to the root file system of the Veeam Agent computer. For example, you can use the snapshot-less mode to back up data that resides in a file system that is not supported for snapshot-based backup with Veeam Agent, such as UFS, ZFS, GFS, GFS2 or OCFS2. You can also use it to back up data that resides in an NFS or CIFS network shared folder.

To create backups in the snapshot-less mode, you must enable this mode in the properties of the file-level backup job. To learn more, see Creating Backup Jobs.

In the snapshot-less mode, Veeam Agent does not create a snapshot of the backed-up volume. Instead, when the backup process starts, Veeam Agent reads files and directories that you selected to back up, and copies backed-up data to the target location.

**IMPORTANT!**

During backup in the snapshot-less mode, Veeam Agent does not track whether files and directories have changed in their original location since the time when the backup process started. To make sure that data in the backup is in the consistent state, you must not perform write operations in the file system that contains the backed-up data until the backup process completes.
How Backup Works

Veeam Agent for Linux performs backup differently depending on the backup type:

- **Volume-level backup**
- **File-level backup**

How Volume-Level Backup Works

During volume-level backup, Veeam Agent performs the following operations for every backup job session:

1. When a new job session starts, Veeam Agent creates a backup file in the target location.

2. In the backup file, Veeam Agent creates a disk for each backed-up disk. In disks, Veeam Agent creates blank partitions that have the same size and location as partitions in backed-up disks.

3. Veeam Agent creates a snapshot of the volume whose data you want to back up. The snapshot is created on the volume that has enough free disk space to contain the snapshot data. To create a snapshot, Veeam Agent uses the *Veeam Agent for Linux Driver*.

   The snapshot helps make sure that the data on the volume is consistent and does not change at the moment of backup. If a data block is about to change on disk during backup, Veeam Agent will copy this block to the snapshot. After the data block is overwritten on the source location, its original copy will remain intact in the snapshot.

   **NOTE:**
   
   Consider the following:
   
   - If you instruct Veeam Agent to back up a database system, Veeam Agent prepares databases for backup before creating a snapshot of the volume. To learn more, see [Backup of Database Systems](#).  
   
   - During backup of data that resides in the Btrfs file system, Veeam Agent does not use its driver to create a snapshot. Instead, Veeam Agent leverages Btrfs capabilities to create a Btrfs snapshot.

4. [For incremental backup] Veeam Agent uses the *Veeam Agent for Linux Driver* to detect what blocks have changed on the volume since the previous job session. The driver keeps this information as a changed block tracking map in the RAM of your computer.

   Mind that every time the driver is unloaded or the Veeam Agent computer is rebooted, the changed block tracking map is reset as well. In such case, to detect what data blocks have changed since the previous job session, Veeam Agent rescans the entire data added to the backup scope and creates a new changed block tracking map. In this case, backup requires greater time.

   To learn about full and incremental backup, see [Backup Chain](#).

5. Veeam Agent copies the partition table and bootloader located on the hard disk to the backup file in the target location.

6. [For incremental backup] Veeam Agent and calculates checksums for each data block and compares them with checksums from the backup file created during the previous job session. If checksums do not match, Veeam Agent will copy the data block to the target location during the next backup process step.

7. Veeam Agent copies data from the following sources:
   
   - Data that did not change on disk during backup is transferred from the source volume.
Data that changed on disk during backup is transferred from the snapshot.

After all the data is transferred, Veeam Agent removes the snapshot.

How File-Level Backup Works

During file-level backup, Veeam Agent performs the following operations for every backup job session:

1. When a new job session starts, Veeam Agent creates a backup file in the target location.

2. In the backup file, Veeam Agent creates a disk. The disk contains a volume with the ext4 file system.

3. Veeam Agent creates a snapshot of the volume which data you want to back up. The snapshot is created on the volume that has enough free disk space to contain the snapshot data. To create a snapshot, Veeam Agent uses the Veeam Agent for Linux Driver.

   The snapshot helps make sure that the data on the volume is consistent and does not change at the moment of backup. If a data block is about to change on disk during backup, Veeam Agent will copy this block to the snapshot. After the data block is overwritten on the source location, its original copy will remain intact in the snapshot.
TIP:

Mind the following:

- You can also set up Veeam Agent to create a file-level backup in the snapshot-less mode. This mode allows you to back up data that resides in any file system mounted to the root file system of the Veeam Agent computer. However, Veeam Agent does not track whether source files have changed since the backup process start. To learn more, see **Snapshot-Less File-Level Backup**.

- Compared to the volume-level backup, the file-level backup, Veeam Agent does not provide changed block tracking mechanism and does not split source files into data blocks. As a result, if you plan to back up a significant amount of data, the file-level backup will require greater time, and created backup files will have greater size.

  For example, you have a 1 GB file, and since the previous backup session only one data block of this file has changed. In case of the file-level backup, Veeam Agent will send the whole 1 GB file to the target again.

4. **[For incremental backup]** To detect files that changed on the Veeam Agent computer since the previous backup session, Veeam Agent reads file metadata and compares last modification time of files in the original location and files in the backup created during the previous job session. If the file has modification time later than the previous job session start time, Veeam Agent considers the file as changed.

   To learn about full and incremental backup, see **Backup Chain**.

5. **[For incremental backup]** Veeam Agent calculates checksums for each data block and compares them with checksums from the backup file created during the previous job session. If checksums do not match, Veeam Agent will copy the data block to the target location during the next backup process step.

6. Veeam Agent copies data that you selected for backup to the target location. As part of this process, Veeam Agent performs the following operations:
   
   a. Enumerates all files in the source location.

   b. For each enumerated file, creates a target file in the volume inside the backup file.

   c. Opens the source and the target files.

   d. Copies file data to the target location from the following sources:
      
      - Data blocks that did not change on disk during backup are transferred from the source volume.
      - Data blocks that changed on disk during backup are transferred from the snapshot.
e. Closes the source and target files.

After all backed-up files and directories are transferred, Veeam Agent removes the snapshot.
Backup Job

To back up your data, you must configure a backup job. The backup job settings define what data you want to back up, what the target location and retention policy for created backups are and how to back up your data. If necessary, you can re-configure the backup job and change its settings at any time.

**NOTE:**

You cannot change the backup job type from volume-level to file-level, and vice versa.

In Veeam Agent for Linux, you can configure several backup jobs with different settings. For example, you can configure one backup job to create volume-level backup and another backup job to create file-level backup. You can configure backup jobs targeted at different backup locations to keep several copies of your backed-up data. You can also configure several backup jobs with individual schedule to fine-tune automatic backup creation process.

**NOTE:**

You can create more than one backup job only if Veeam Agent for Linux operates in the Workstation or Server edition. To learn more, see [Product Editions](#).

Veeam Agent for Linux launches the backup job according to the schedule you define. You can schedule the job to start at specific time daily or on specific week days. You can also start a backup job manually to perform backup on demand when needed.

Backup job scheduling settings are configured globally for all accounts of the Linux OS. For every backup job, Veeam Agent for Linux creates a record in the `crontab` configuration file of the root account. As a result, Veeam Agent for Linux can start a backup job automatically regardless of the currently running user session.

You can define schedule for a job in Veeam Agent for Linux or edit the `crontab` file directly to fine-tune the schedule. To learn more, refer to the Cron job scheduler documentation.

Backup Job Scripts

You can instruct Veeam Agent for Linux to run custom scripts within the backup job session:

- **Pre-job and post-job scripts** — Veeam Agent runs these scripts before the backup job starts and after the backup job completes. You can use pre-job and post-job scripts, for example, to configure email notifications about jobs performed by Veeam Agent.

- **Pre-freeze and post-thaw scripts** (in the Server edition only) — Veeam Agent runs these scripts before and after creating a snapshot. For example, the pre-freeze script may quiesce the file system and application data to bring the Linux OS to a consistent state before Veeam Agent creates a snapshot. After the snapshot is created, the post-thaw script may bring the file system and applications to their initial state.

Script settings are enabled at the job level. If Veeam Agent operates in the Server edition and you want to configure multiple backup jobs, you can specify individual scripts for each job.

Scripts must be created beforehand. You must specify paths to them in the job settings. Veeam Agent supports scripts in the SH file format.

Pre-Job and Post-Job Scripts

You can instruct Veeam Agent for Linux to run custom pre-job and post-job scripts. Veeam Agent executes the pre-job script directly before the backup job starts. After the backup job completes, Veeam Agent executes the post-job script.
Veeam Agent starts the backup job regardless of the pre-job script result. If the pre-job script fails to execute, Veeam Agent will always start the backup job. Then, after the backup job completes, Veeam Agent will execute the post-job script.

The script is considered to be executed successfully if "0" is returned.

The default time period for script execution is 10 minutes. After this period expires, Veeam Agent stops executing the script and displays a warning message in the job session. If the script fails to execute before the timeout expires, Veeam Agent does not display warning messages in the job session.

Pre-Freeze and Post-Thaw Scripts

You can instruct Veeam Agent for Linux to run custom pre-freeze and post-thaw scripts. Veeam Agent executes the pre-freeze script before creating a snapshot. After the snapshot is created, Veeam Agent executes the post-thaw script.

The script is considered to be executed successfully if "0" is returned.

The default time period for script execution is 10 minutes. After this period expires, Veeam Agent stops executing the script.

By default, if the pre-freeze or post-thaw script fails to execute, Veeam Agent does not start the backup job. However, you can instruct Veeam Agent to ignore errors that occur during the script execution process. To allow Veeam Agent to start backup jobs regardless of the script execution result, in the /etc/veeam/veeam.ini configuration file, uncomment the ignoreFreezeThawFailures parameter and set its value to true.

If Veeam Agent is set up to ignore script errors, and the pre-freeze or post-thaw script fails to execute, Veeam Agent will start the backup job. After the job successfully completes, Veeam Agent will display the Warning status for the job session.

NOTE:
You can specify pre-freeze and post-thaw scripts only if Veeam Agent for Linux operates in the Server edition. If these scripts were enabled for the job while Veeam Agent operated in the Server edition, and then Veeam Agent has switched to another edition (for example, to the Free edition after the license has expired), the backup job will fail. You will need to delete the existing job and create a new backup job without pre-freeze and post-thaw scripts enabled.

File System Indexing

You can instruct Veeam Agent for Linux to create an index of files and directories located on the Veeam Agent computer during backup. File indexing allows you to search for specific files inside Veeam Agent backups and perform 1-click restore in Veeam Backup Enterprise Manager.

File indexing is enabled at the job level. You can specify granular indexing settings for each job.
IMPORTANT!

Indexing mechanism does not recognize file exclusion masks. If you specify masks to exclude certain files in a file-level backup job, Veeam Agent for Linux will nevertheless index all files located in the directories that have been selected for backup.

For example, you have included the /home directory into the backup and specified the *.pdf exclusion mask. The Index everything option is enabled for the backup job. In this case, when you browse the resulting backup in Veeam Backup Enterprise Manager, PDF files will be displayed in the /home directory as if they were backed up.

Requirements for File System Indexing

- Veeam Agent for Linux must have either Workstation or Server license installed.
- The Linux system must have the mlocate and tar tools installed (standard tools for majority of Linux distributions).

NOTE:

Consider the following:

- File system indexing is optional. If you do not enable this option in the backup job settings, you will still be able to perform 1-click restore from the backup created with such backup job. For more information, see the Preparing for File Browsing and Restore section in the Veeam Backup Enterprise Manager User Guide.
- If SELinux is enabled in the Linux OS, file system indexing may fail.
Backup Repository

A backup job configured in Veeam Agent for Linux creates backup files in a backup repository. A backup repository is a directory on the storage where you want to keep backup files. You can use the following types of disk-based storage to create a backup repository:

- Local (internal) storage of the protected machine (not recommended).
- Direct attached storage (DAS), such as USB, eSATA or Firewire external drives.
- Network Attached Storage (NAS) able to represent itself as SMB (CIFS) or NFS share.
- Veeam Backup & Replication 11 or later backup repository.
- Veeam Backup & Replication 11 or later cloud repository.

**IMPORTANT!**
A backup repository must be created on a separate volume from a volume whose data you plan to back up.

Veeam Agent for Linux works with backup storage differently depending on the way you configure and start backup jobs — with the Veeam Agent control panel or command line interface.

Backup Location and Control Panel

If you use the Veeam Agent control panel to perform backup tasks, you do not have to deal with backup repositories. When you specify a target location for backup in the Backup Job wizard, Veeam Agent configures the backup repository automatically. Veeam Agent saves path to the specified backup location, assigns to this location a unique name and ID and saves this information in the database. The information is used by Veeam Agent and is not displayed in the control panel.

If you target a backup job at the network shared folder, every time the backup job starts, Veeam Agent will automatically mount the shared folder to the `/tmp/veeam` directory in the computer file system and create a backup file in this directory. After the backup job completes, Veeam Agent will automatically unmount the network shared folder.

You can target several backup jobs to individual backup locations or use the same target location for several backup jobs. This may be useful if you want to back up different types of data to separate locations or to keep all backed-up data at one place.

Backup Repository and Command Line Interface

If you work with Veeam Agent for Linux using the command line interface, you must deal with backup repositories depending on the target location selected for the backup job.

If you target a backup job at a local directory or network shared folder, you must create a repository before you configure a backup job:

- In case of a local directory, you specify a name for the repository and a local directory in which Veeam Agent will create backup files. To learn more, see Creating Repository in Local Directory.
• In case of a network shared folder, you specify a name for the repository, a path to the network shared folder in which Veeam Agent will create backup files, a type of the network shared folder and additional mounting options.

Every time the backup job starts, Veeam Agent will automatically mount the shared folder to the /tmp/veeam directory in the computer file system and create a backup file in this directory. After the backup job completes, Veeam Agent will automatically unmount the network shared folder. To learn more, see Creating Repository in NFS Share and Creating Repository in SMB Share.

If the directory to which the shared folder should be mounted resides on the backed-up volume, the backup job may fail.

If you target a backup job at a Veeam backup repository or cloud repository, you do not need to create repositories. Before configuring the backup job, you must connect to the Veeam backup server or Veeam Cloud Connect service provider. To learn more, see Connecting to Veeam Backup Server and Connecting to Service Provider.

You can configure several backup repositories and target different backup jobs at these repositories. This may be useful if you want to back up different types of data to separate locations or to keep several copies of your backed-up data.
Backup Chain

Every backup job session produces a new backup file in the target location. Backup files make up a backup chain. The backup chain can contain files of two types: full backups and incremental backups.

- During the first backup job session, Veeam Agent for Linux performs full backup. Veeam Agent for Linux copies all data that you have chosen to back up (entire volumes and directories) and stores the resulting full backup file (VBK) in the target location. The full backup takes significant time to complete and produces a large backup file: you have to copy the whole amount of data.

- During subsequent backup job sessions, Veeam Agent for Linux performs incremental backups. It copies only new or changed data relatively to the last backup job session and saves this data as an incremental backup file (VIB) in the target location. Incremental backups typically take less time than full backup: you have to copy only changes, not the whole amount of data.

After several backup cycles, you have a chain of backup files in the target location: the first full backup file and subsequent incremental backup files. Every backup file contains a restore point for backed up data. A restore point is a "snapshot" of your data at a specific point in time. You can use restore points to roll back your data to the necessary state.

To recover data to a specific restore point, you need a chain of backup files: a full backup file plus a set of incremental backup files following this full backup file. If some file from the backup chain is missing, you will not be able to roll back to the necessary state. For this reason, it is recommended that you do not delete separate backup files manually. To learn more, see Deleting Backups.

Types of Backup Files

Veeam Agent for Linux produces backup files of the following types:

- **VBK** — full backup file.
- **VIB** — incremental backup file.
- **VBM** — backup metadata file. The backup metadata file is updated with every backup job session. It contains information about the computer on which the backup was created, every restore point in the backup chain, how restore points are linked to each other and so on. The backup metadata file is required for performing file-level and volume-level restore operations.
Backup Retention Policy

Restore points in the backup chain are not kept forever. They are removed according to the retention policy. The retention policy helps maintain the life cycle of restore points and make sure that backup files do not consume the whole disk space.

Veeam Agent for Linux retains the number of latest restore points defined by the user. During every backup job session, Veeam Agent for Linux checks if there is any obsolete restore point in the backup chain. If some restore point is obsolete, it is removed from the chain.

Removing Backups by Retention

When removing obsolete restore points, Veeam Agent for Linux does not simply delete backup files from disk. It transforms the backup chain so that the backup chain always contains a full backup file on which subsequent incremental backup files are dependent. To maintain the consistency of the backup chain, Veeam Agent for Linux uses the following rotation scheme:

1. During every backup job session Veeam Agent for Linux adds a backup file to the backup chain and checks if there is an obsolete restore point.
2. If an obsolete restore point exists, Veeam Agent for Linux transforms the backup chain. As part of this process, it performs the following operations:

   a. Veeam Agent for Linux re-builds the full backup file to include in it data of the incremental backup file that follows the full backup file. To do this, Veeam Agent for Linux injects into the full backup file data blocks from the earliest incremental backup file in the chain. This way, a full backup ‘moves’ forward in the backup chain.

   In the diagram below, the full backup file is shown first, followed by the earliest incremental backup file. The data blocks from the incremental backup file are injected into the full backup file, effectively moving the full backup file forward in the chain.

   b. The earliest incremental backup file is removed from the chain as redundant: its data has already been injected into the full backup file, and the full backup file includes data of this incremental backup file.

   In the diagram below, the earliest incremental backup file is shown as crossed out, indicating that it has been removed from the chain.

Active Full Backup

In some cases, you need to regularly create a full backup. For example, your corporate backup policy may require that you create a full backup on weekend and run incremental backup on work days. To let you conform to these requirements, Veeam Agent for Linux lets you create active full backups.

When Veeam Agent for Linux performs active full backup, it produces a full backup file and adds this file to the backup chain.

The active full backup resets the backup chain. All incremental backup files use the latest active full backup file as a new starting point. A previously used full backup file and its subsequent incremental backup files remain on the disk. After the last incremental backup file created prior to the active full backup becomes outdated, Veeam Agent for Linux automatically deletes the previous backup chain. To learn more, see Retention Policy for Active Full Backups.
You can create active full backups manually or schedule a backup job to create active full backups periodically. To do this, you can use the Veeam Agent for Linux control panel or command line interface.

- To learn how to configure active full backup schedule and create active full backups with the Veeam Agent for Linux control panel, see Active Full Backup Settings and Starting Backup Job from Control Panel.
- To learn how to configure active full backup schedule and create active full backups with the Veeam Agent for Linux command line interface, see Configuring Active Full Backup Schedule and Creating Active Full Backups.

Retention Policy for Active Full Backups

To be able to restore data from a Veeam Agent backup, you need to have a full backup file and a chain of subsequent incremental backup files on the disk. If you delete a full backup file, the whole chain of incremental backup files will become useless. In a similar manner, if you delete any incremental backup file before the point to which you want to roll back, you won’t be able to restore data (since later incremental backup files depend on earlier incremental backup files).

For this reason, if you create an active full backup, in some days there will be more restore points on the disk than specified by retention policy settings. Veeam Agent for Linux will remove the full backup chain only after the last incremental backup file in the chain becomes outdated.

For example, the retention policy is set to 3 restore points. A full backup file is created on Sunday, incremental backup files are created on Monday and Tuesday, and an active full backup is created on Wednesday. Although the backup chain now contains 4 restore points, Veeam Agent for Linux will not delete the previous backup chain. Veeam Agent for Linux will wait for the next 2 incremental backup files to be created, and only then will delete the whole previous chain, which will happen on Friday. As a result, although the retention policy is set to 3 restore points, the actual number of backup files on the disk will be greater for some time.

Veeam Agent for Linux treats the active full backup in the same way as a regular full backup. If some restore point becomes obsolete, Veeam Agent for Linux will re-build the full backup file to include in it data of the incremental backup file that follows the full backup file. After that, Veeam Agent for Linux will remove the earliest incremental backup file from the chain as redundant.
Backup of Database Systems

You can use Veeam Agent for Linux to create transactionally consistent backups of Veeam Agent machines that run one of the following database systems:

- Oracle database system
- MySQL database system
- PostgreSQL database system

**IMPORTANT!**

Consider the following:

- You can specify settings for database system processing only if Veeam Agent for Linux operates in the Server edition.
- Veeam Agent supports processing of database systems for the volume-level backup only.
- Veeam Agent does not support processing of multiple database systems on one Veeam Agent computer.
- Veeam Agent does not support 32-bit database systems installed on a 64-bit Linux OS.

To process database systems with Veeam Agent for Linux, enable application-aware processing for the backup job:

- If you work with Veeam Agent using the Veeam Agent control panel, configure application-specific settings at the Advanced step of the Backup Job wizard. To learn more, see Specify Advanced Backup Settings.
- If you work with Veeam Agent using the command line interface, create the backup job, then specify application-specific settings for this job. To learn more, see Creating Volume-Level Backup Job and Configuring Database Processing Settings.

**Oracle Backup**

You can use Veeam Agent for Linux to create transactionally consistent backups of Veeam Agent machines that run the Oracle database system.

**NOTE:**

You can use Veeam Explorer for Oracle to restore Oracle databases from a Veeam Agent for Linux backup. For information about item-level recovery of Oracle systems, see Veeam Explorers User Guide.

**How Oracle Processing Works**

To ensure that the backed-up data is in the consistent state, Veeam Agent for Linux performs the Oracle database system processing. To process the database system, Veeam Agent performs the following operations:

1. When the backup job starts, Veeam Agent obtains information about Oracle databases that run on the Veeam Agent machine.
2. Veeam Agent connects to the Oracle database and operates depending on the database state:
   - Shutdown state
   - ARCHIVELOG mode
   - NOARCHIVELOG mode
After Veeam Agent for Linux finishes database system processing, Veeam Agent proceeds to the next step of the backup process. To learn more, see How Backup Works.

**Processing of Database in Shutdown State**

If the database is shut down, Veeam Agent skips it and connects to the next database. The skipped database will be included in the backup. To restore such database, you must restore the entire volume that contains the database. You cannot restore the database as an independent item using Veeam Explorer for Oracle. To learn more, see Veeam Explorers User Guide.

Veeam Agent displays a warning message about the database that is shut down in the job session logs. The backup job does not fail.

**Processing of Database in ARCHIVELOG Mode**

If the Oracle database is running in the ARCHIVELOG mode, the Oracle database system keeps archived logs that allow to recover all committed transactions of the database. To learn more, see Oracle documentation.

If the database operates in the ARCHIVELOG mode, Veeam Agent performs the following operations:

1. Veeam Agent switches the database to the backup mode. Veeam Agent changes the database state using the Oracle functionality.
2. Veeam Agent creates a snapshot of the volume.
3. Veeam Agent returns the database to the initial state.

**Processing of Database in NOARCHIVELOG Mode**

If the Oracle database is running in the NOARCHIVELOG mode, the Oracle database system does not create archived logs. Logs that are created before the database is switched to NOARCHIVELOG remain untouched. In this mode, you can only restore the database to the point of full database backup. You cannot recover transactions subsequent to that full database backup.

If the database operates in the NOARCHIVELOG mode, Veeam Agent performs the following operations:

1. Veeam Agent shuts down the database. Veeam Agent changes the database states using the Oracle functionality.
2. Veeam Agent creates a snapshot of the volume.
3. Veeam Agent returns the database to the initial state.

**Authentication Methods**

Veeam Agent for Linux can connect to the Oracle database system and perform Oracle archived logs backup and/or deletion using one of the following account types:

- **System account** — Veeam Agent uses the account of the Veeam Agent machine OS. To connect to the Oracle database system, the account must be a member of the group that owns Oracle database files.
- **Oracle account** — Veeam Agent uses the Oracle account. To connect to the Oracle database system, the account must have SYSDBA rights.
Archived Log Processing

NOTE:
Veeam Agent for Linux operating in the standalone mode supports the backup of archived logs, but does not support a separate schedule and retention policy for the backup of archived logs. This functionality is available only for Veeam Agent for Linux operating in the managed mode within the Veeam Agent management scenario. For more information, see Oracle Archived Log Settings section in the Veeam Agent Management Guide.

In the ARCHIVELOG mode, the Oracle database system stores database archived logs to a certain location on the machine that runs the database system, as specified by the database administrator. Veeam Agent allows you to set up the following ways of archived logs processing:

- *Delete logs older than the specified time (in hours).* After the backup job completes, Veeam Agent deletes archived logs that are older than the specified time from the Veeam Agent machine. This helps make sure that logs do not overflow the storage space on the processed machine.

- *Delete oldest logs larger than the specified size (in GB).* After the backup job completes, Veeam Agent checks whether the total size of archived logs exceeds the specified size. After that, Veeam Agent deletes oldest archived logs that exceed the specified size from the processed machine. This helps make sure that logs do not overflow the storage space on the Veeam Agent machine.

- *Do not delete archived logs.* Log files remain untouched on the Veeam Agent machine.

Veeam Agent processes archive logs via Oracle Call Interface (OCI).

Requirements and Limitations for Oracle Processing

- Oracle Database versions 11g – 19c are supported for all operating systems supported by Veeam Agent for Linux. To learn more, see System Requirements.

- Automatic Storage Management (ASM) is not supported.

- Oracle Real Application Clusters (RAC) are not supported.

- Oracle Grid Infrastructure is not supported.

- Oracle Database Express Edition is not supported.

- SAP on Oracle is not supported.

- Oracle Database architectures with Data Guard are not supported.

MySQL Backup

You can use Veeam Agent for Linux to create transactionally consistent backups of Veeam Agent machines that run the MySQL database system.
How MySQL Processing Works

To ensure that the backed-up data is in the consistent state, Veeam Agent for Linux performs the MySQL database system processing. To process the database system, Veeam Agent performs the following operations:

1. When the backup job starts, Veeam Agent connects to the MySQL database system and obtains the list of tables.

2. Veeam Agent locks base tables that are based on the MyISAM storage engine. Veeam Agent changes the table state using the MySQL functionality. Tables based on the InnoDB storage engine do not require locking.
   
   Keep in mind that Veeam Agent supports processing of tables based on the MyISAM and InnoDB storage engines only. Veeam Agent does not support tables that use other storage engines.

3. Creates a snapshot of the volume.

4. Unlocks tables locked at the step 2.

After Veeam Agent unlocks tables, Veeam Agent proceeds to the next step of the backup process. To learn more, see How Backup Works.

Authentication Methods

**IMPORTANT!**

To process the MySQL database system, the MySQL account must have the following privileges:

- SELECT for all tables. If the MySQL account does not have the SELECT privilege for the table, Veeam Agent cannot access table metadata. As a result, Veeam Agent does not process the table. To learn more, see MySQL documentation.
- LOCK TABLES. If the MySQL account does not have the LOCK TABLES privilege, Veeam Agent does not process tables based on the MyISAM storage engine.

To obtain information about privileges that are assigned to the account, use MySQL functionality, for example, the SHOW GRANTS statement. To learn more, see MySQL documentation.

Veeam Agent for Linux can connect to the MySQL database system using one of the following methods:

- **Password** — Veeam Agent uses the MySQL account credentials that you specify in the backup job settings.
- **Password file** — Veeam Agent uses the MySQL account credentials that are stored in the .my.cnf password file. To learn more about password file configuration, see Preparing Password File for MySQL Processing.

Requirements and Limitations for MySQL Processing

- Veeam Agent for Linux supports processing of MySQL database system version 5.6 — 8.0.
- Configurations with multiple MySQL installations and/or instances on the same machine are not supported.
- MySQL Cluster versions are not supported.

PostgreSQL Backup

You can use Veeam Agent for Linux to create transactionally consistent backups of Veeam Agent machines that run the PostgreSQL database system.
How PostgreSQL Processing Works

To ensure that the backed-up data is in the consistent state, Veeam Agent performs the PostgreSQL database processing. To process the database system, Veeam Agent performs the following operations:

1. When the backup job starts, Veeam Agent forces a write-ahead log checkpoint. This command fastens the database system restore. To learn more, see PostgreSQL documentation.

2. Creates a snapshot of the volume and proceeds to the next step of the backup process. To learn more, see How Backup Works.

Authentication Methods

Veeam Agent for Linux can connect to the PostgreSQL database system using one of the following methods:

- **Database user with password** — Veeam Agent uses the PostgreSQL account credentials that you specify in the backup job settings.

- **Database user with password file** — Veeam Agent uses the PostgreSQL account credentials that are stored in the `.pgpass` password file. To learn more about password file configuration, see Preparing Password File for PostgreSQL Processing.

- **System user without password** — Veeam Agent uses the peer authentication. In the peer authentication method, Veeam Agent for Linux uses the OS account as the PostgreSQL database user name.

Requirements and Limitations for PostgreSQL Processing

- Veeam Agent for Linux supports processing of the PostgreSQL database system version 9.4 — 12.1.

- Configurations with multiple PostgreSQL installations and/or instances on the same server are not supported.
Data Restore

Veeam Agent for Linux offers two data restore scenarios:

- You can perform volume-level restore to recover the entire system image of your computer or specific computer volumes. To learn more, see Volume-Level Restore.

- You can perform file-level restore to recover individual files and directories. To learn more, see File-Level Restore.
Volume-Level Restore

If data on a computer volume gets corrupted, you can restore this volume from the backup. For volume-level restore, you can use backups that were created at the volume level. File-level backups cannot be used for volume restore.

When you perform volume-level restore, Veeam Agent for Linux restores the entire content of the volume. It retrieves from the backup data blocks pertaining to a specific volume and copies them to the necessary location.

Keep in mind that you cannot browse the volume in the backup and select individual files and directories for restore. For granular file-level restore, you can use the File-Level Restore option.

A volume can be restored to its original location or new location. If you restore the volume to its original location, Veeam Agent for Linux overwrites data on the original volume. If you restore the volume to a new location, and the target disk contains any data, Veeam Agent for Linux overwrites data in the target location with data retrieved from the backup.

Limitations for Volume-Level Restore

Volume restore has the following limitations:

- You cannot restore the system volume to its original location.
- You cannot restore a volume to the volume on which the Linux swap space is hosted.
- You cannot restore a volume to the volume where the backup file used for restore is located.

To overcome the first two limitations, you can create a Veeam Recovery Media and use the Volume Restore wizard for volume-level restore. To learn more, see Veeam Recovery Media.
File-Level Restore

If you have lost or modified files and directories on your computer by mistake, you can restore a copy of the necessary objects from the backup. For file-level restore, you can use a backup of any type:

- Volume-level backup
- File-level backup

Veeam Agent for Linux does not simply extract files and folders from the backup file. During file-level restore, Veeam Agent for Linux performs the following operations:

1. Veeam Agent for Linux associates the backup file with a loop device, for example, `/dev/loop0`, to make the backup file accessible as a block device.

2. Veeam Agent for Linux mounts the loop device to the mount point directory in the computer’s file system.
   - For file-level restore with the Veeam Agent for Linux control panel or Veeam Recovery Media, Veeam Agent for Linux mounts the backup content to the `/mnt/backup` directory.
   - For file-level restore with the command line interface, you can specify a directory in which Veeam Agent for Linux should mount the backup content.

After the backup content is mounted, you can use Linux command line utilities or preferred file browser to work with restored files and directories. You can browse for files and directories in the mounted backup and copy them to their initial location or to a new location.
Veeam Recovery Media

Veeam Agent for Linux lets you use the Veeam Recovery Media — a recovery image of the Linux OS that provides an alternative way to boot your computer.

The recovery image includes a custom Linux OS with the limited functionality. It comprises Linux kernel and a set of GNU/Linux utilities necessary to boot the computer and perform basic administration tasks. If the OS installed on the computer fails to start for some reason, you can boot the recovery image OS. After booting, you can do the following:

- You can restore data from a backup to your computer. For this scenario, you must have a backup created with Veeam Agent for Linux.
- You can use Linux OS tools to diagnose problems and fix errors on your computer.

The recovery image can be helpful if one of the following errors occur:

- The OS on the computer fails to start.
- You want to perform bare-metal restore from the backup on the computer without the OS and other software installed.
- You want to restore the system volume of the computer and so on.

Veeam Recovery Media is distributed as an ISO image. The ISO image file can be downloaded from this Veeam webpage. You can burn the ISO image file to different kinds of media:

- Removable storage devices such as USB drives or SD cards
- CD/DVD/BD

When you boot from the Veeam Recovery Media, you can use the recovery environment to fix the OS system errors on your computer or restore data from the backup. Veeam Agent for Linux offers a set of tools for the computer system image and data recovery:

- Restore volumes — the Veeam Recovery wizard to recover data on the original computer or perform bare-metal recovery.
- Restore files — the File Level Restore wizard to restore files and folders to the original location or to a new location.
- Switch to command line — Linux shell prompt with standard utilities to diagnose problems and fix errors.
Drivers in Veeam Recovery Media

The generic Veeam Recovery Media available for download at the Veeam website contains the following data:

1. Set of files required to start the recovery image OS from the recovery media.
2. Set of Veeam tools for the computer system image and data recovery.
3. Set of Linux command line tools to diagnose problems and fix errors on your computer.
4. Drivers required to run hardware and devices on your computer in a regular way. The generic Veeam Recovery Media contains drivers included in the Linux kernel version 4.18.11. When you boot your computer from the Veeam Recovery Media, drivers from the Veeam Recovery Media are automatically loaded on the recovery image OS.

If your computer uses hardware that requires drivers not included in the generic Veeam Recovery Media, you can create a custom Veeam Recovery Media. Veeam Agent for Linux will copy the Linux kernel running on your computer with its currently loaded modules and include them into the custom Veeam Recovery Media.
Integration with Veeam Backup & Replication

If you plan to use Veeam Agent for Linux 5.0 with Veeam Backup & Replication, you must install Veeam Backup & Replication 11 on the Veeam backup server.

You can store backup files created with Veeam Agent for Linux on backup repositories managed by Veeam Backup & Replication. To do this, you must select a Veeam Backup & Replication backup repository as a target location in the properties of the backup job. To store Veeam Agent backups, you can use a simple backup repository or a scale-out backup repository.

NOTE:
Consider the following:

- The current guide covers subjects related to Veeam Agent for Linux operating in the standalone mode.
- You can also use Veeam Backup & Replication to manage Veeam Agent for Linux on computers in your infrastructure. As part of the Veeam Agent management scenario, you can remotely deploy Veeam Agent to your computers, as well as configure and manage Veeam Agent backup jobs in Veeam Backup & Replication. To learn more, see Veeam Agent Management Guide.
- If you create a backup job with the Veeam Agent command line interface, you need to specify a Veeam backup repository in the backup job settings. Veeam backup repository appears in the list of backup repositories after you connect to a Veeam backup server. To learn more, see Managing Veeam Backup & Replication Servers.

Veeam Agent for Linux works with the Veeam Backup & Replication backup repository as with any other backup repository. Backup files are stored to a separate folder; you can perform standard restore operations using these files.

Information about Veeam Agent backups stored on the Veeam Backup & Replication backup repositories, backup jobs and sessions becomes available in the Veeam Backup & Replication console:

- The Veeam Agent for Linux backup job is displayed in the list of jobs in Veeam Backup & Replication.
- Backup files created with Veeam Agent for Linux are displayed in the list of backups, under the Agents node.
- Performed job sessions are available in the History view of Veeam Backup & Replication.

Backup administrators working with Veeam Backup & Replication can perform a set of operations with Veeam Agent backups:

- Perform data protection operations: copy Veeam Agent backups to secondary backup repositories and archive these backups to tape.
- Perform restore operations: restore individual files and directories, application items from Veeam Agent backups; restore computer disks and convert them to the VMDK, VHD or VHDX format; restore to Microsoft Azure and Amazon EC2.
• Perform administrative tasks: disable and delete Veeam Agent backup jobs, remove Veeam Agent backups and so on.
Backup to Veeam Cloud Connect Repository

If you want to store your data in the cloud, you can connect to a Veeam Cloud Connect service provider (SP) and create Veeam Agent backups in a cloud repository. To do this, you must provide credentials of the tenant (or subtenant) account that you obtained from the SP, and select a cloud repository as a target for backup files in the properties of the backup job. To learn more, see Veeam Cloud Connect Repository Settings.

NOTE:
Consider the following:

- You can create Veeam Agent backups in a cloud repository if the SP backup server runs Veeam Backup & Replication 11.
- Backup to a cloud repository is available if Veeam Agent for Linux operates in the Workstation or Server edition.
Managing Veeam Agent in Veeam Backup & Replication

Veeam Backup & Replication lets you automate management of Veeam Agent on multiple computes in your infrastructure. You can deploy Veeam Agent for Linux, configure Veeam Agent backup jobs and perform other data protection and administration tasks on remote computers. To use the Veeam Agent management functionality in Veeam Backup & Replication, you must install Veeam Backup & Replication 11 on the Veeam backup server.

To learn more, see Veeam Agent Management Guide.
Requirements

Before you install Veeam Agent for Linux, make sure that the target computer meets the system requirements and all required ports are open.
System Requirements

The protected Linux-based endpoint must meet requirements listed in the table below.

**NOTE:**
The following system requirements apply to Veeam Agent for Linux operating in the standalone mode. To learn about system requirements for Veeam Agent managed by Veeam Backup & Replication, see the System Requirements section in the Veeam Agent Management Guide.

<table>
<thead>
<tr>
<th>Specification</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Hardware</strong></td>
<td>CPU: x86-64 processor (i386 or later).</td>
</tr>
<tr>
<td></td>
<td>Memory: 1 GB RAM or more. Memory consumption varies depending on the backup type and the total amount of backed-up data.</td>
</tr>
<tr>
<td></td>
<td>Disk Space: 100 MB free disk space for product installation.</td>
</tr>
<tr>
<td></td>
<td>Network: 10 Mbps or faster network connection to a backup target.</td>
</tr>
<tr>
<td></td>
<td>System firmware: BIOS or UEFI.</td>
</tr>
<tr>
<td></td>
<td>Disk layout: MBR or GPT.</td>
</tr>
<tr>
<td></td>
<td>For virtual machines: Only full virtualization type is supported. Containers and paravirtualized instances are not supported. Oracle VM virtual machines are supported with limitations.</td>
</tr>

### File System

**Important!** Check considerations and limitations that apply to the list of supported file systems.

Veeam Agent for Linux supports consistent snapshot-based data backup for the following file systems:

- Btrfs (for OSes that run Linux kernel 3.16 or later)
- Ext 2/3/4
- F2FS
- FAT16
- FAT32
- HFS
- HFS+
- JFS
- NILFS2
- NTFS
- ReiserFS
- XFS

The supported file system (except for Btrfs) can reside on a simple volume or LVM2 volume; volumes protected with encryption software such as dm-crypt are supported. Btrfs is supported only if it resides directly on a physical device with no additional abstraction layers (such as LVM, software RAID, dm-crypt and so on) below or above it.

Data that resides on other file systems and volumes (including NFS and SMB shares) can be backed up using the snapshot-less mode. For details, see **Snapshot-Less File-Level Backup.**

### Considerations and Limitations

**OS**

- Linux kernel version 2.6.32 or later is supported as long as you use kernels supplied by your distribution. Consider the following limitations:
  - Fedora is supported up to kernel 5.7.7.
  - openSUSE Tumbleweed is supported up to kernel 5.7.7.
  - Linux kernel 2.6.32-754.6.3 in RHEL and Oracle Linux (RHCK) is not supported.
- Only GA versions of the listed distributions that have been released before the current version of Veeam Agent for Linux are supported.
• Use the `dkms` packages with the following distributions instead of the pre-built binary `veeamsnap` kernel module packages:
  o Debian 9.0 - 10.4
  o Oracle Linux 7 - 8.2 (RHCK)
  o Oracle Linux 7 - Oracle Linux 8.0 (up to UEK R6)
  o Fedora 32
  o openSUSE Tumbleweed

• Pre-built binary `veeamsnap` kernel module packages require kernel 2.6.32-131.0.15 or later for RHEL 6 (excluding 2.6.32-279.el6.i686) and 3.10.0-123 or later for CentOS / RHEL 7.0 – 7.7.

• RHEL 6.10, RHEL / CentOS / Oracle Linux (RHCK) 7.7 and 8.3 are supported up to certain kernel versions. For details, see this Veeam KB article.

**File System**

• Veeam Agent for Linux does not back up volumes that reside on USB devices and SD cards.

• Total size of all file systems included in a file-level backup must not exceed 218 TB. Size of a file included in a file-level backup must not exceed 16 TB.

• All extended attribute names and values of a file must not exceed 4096 bytes (size of a default ext4 file system block). Veeam Agent does not back up attributes exceeding the limit.

  For the kernel version 4.13 or later, if a value of extended attribute exceeds the limit, Veeam Agent uses the `ea_inodes` feature. Backups created using the `ea_inodes` feature cannot be mounted on kernel versions up to 4.12.

• Each volume included in a backup must have a unique UUID.

• The veeamsnap module provides RAM-based changed block tracking (CBT) mechanism. Every time the module is unloaded or Veeam Agent for Linux computer is rebooted, CBT data is reset. As a result, Veeam Agent reads the entire data added to the backup scope to detect what blocks have changed since the last job session, and incremental backup requires greater time.

• Backup of machines used as cluster nodes is not supported (that includes backup of machines that use shared disks, clustered file systems or clustered LVM).

• Certain limitations for EMC PowerPath configuration apply. To learn more, see this Veeam KB article.

• BFQ I/O scheduler is not supported.

• Sparse files are not supported. Veeam Agent backs up and restores sparse files as regular files.

**Software**

**IMPORTANT!**

Linux user account used to work with Veeam Agent for Linux must have the `/bin/bash` shell set as the default shell.

• The following packages are not required for CentOS, RHEL and SLES distributions if a pre-built binary veeamsnap package is to be installed.
  o `dkms`
- gcc
- make
- perl
  - linux-headers (for Debian-based systems)
  - kernel-headers (for RedHat-based systems)
  - kernel-devel (for RedHat-based systems)
For details, see Installing Veeam Agent for Linux.

- Version of the following packages varies according to the Linux kernel version that you use:
  - linux-headers (for Debian-based systems)
  - kernel-headers (for RedHat-based systems)
  - kernel-devel (for RedHat-based systems)

- For openSUSE and SLES distributions, either of the following packages is required: `libncurses5` or `libncurses6`.

- The `dmidecode` package is required for Veeam Agent management — a valid BIOS UUID must be obtainable either from `dmidecode | grep -i uuid` or from `/sys/class/dmi/id/product_uuid`. Each Veeam Agent that consumes a license installed in Veeam Backup & Replication must have a unique BIOS UUID. If a valid UUID cannot be obtained, Veeam will generate it automatically.

- The `libmysqlclient` package is required to process MySQL database system located on the Veeam Agent server. For details, see Backup of MySQL Database. Package version varies according to the MySQL database system version that you use.

- The `libpq5` package is required to process PostgreSQL database system located on the Veeam Agent server. For details, see Backup of PostgreSQL Database.

- The `python3` package is required for CentOS, RHEL 7.0 and later if a pre-built binary `kmod-veeam snap` package is to be installed.

- If the `python3` package is not available for your Linux distribution, you can use the `python3-setuptools` package or another package that represents Python 3 in your Linux distribution. For instructions on how to install such packages, refer to the official information resources for your Linux distribution.

**Backup Source**

Any file systems and devices that are accessible from the host OS. To learn about limitations, see File System.

**Backup Target**

Backup can be performed to the following types of storage:

- Local (internal) storage of the protected computer (not recommended).
- Direct attached storage (DAS), such as USB, eSATA or Firewire external drives.
- Network Attached Storage (NAS) able to represent itself as SMB (CIFS) or NFS share. Requires `cifs-utils` or `nfs-utils` packages to be installed on the Veeam Agent for Linux computer, depending on a network storage type.
• Veeam Backup & Replication 11 or later backup repository (including deduplication appliances).
• Veeam Cloud Connect 11 or later cloud repository.

Network

Consider the following:

• Veeam Agent for Linux should be able to establish a direct IP connection to the Veeam Backup & Replication server. Thus, Veeam Agent for Linux cannot work with Veeam Backup & Replication that is located behind the NAT gateway.

• Domain names of the Veeam Agent computer, Veeam Backup & Replication server and other servers in the Veeam backup infrastructure must be resolvable into IPv4 addresses.
# Used Ports

Make sure that you open ports listed below to enable proper work of Veeam Agent for Linux.

<table>
<thead>
<tr>
<th>From</th>
<th>To</th>
<th>Protocol</th>
<th>Port</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Veeam Agent computer</td>
<td>Veeam backup server</td>
<td>TCP</td>
<td>10006</td>
<td>Default port used for communication with the Veeam backup server. Data between the Veeam Agent for Linux computer and backup repositories is transferred directly, bypassing Veeam backup servers.</td>
</tr>
<tr>
<td></td>
<td>Shared folder SMB (CIFS) share</td>
<td>TCP, UDP</td>
<td>135, 137 to 139, 445</td>
<td>Ports used as a transmission channel from the Veeam Agent for Linux computer to the target SMB (CIFS) share.</td>
</tr>
<tr>
<td></td>
<td>Shared folder NFS share</td>
<td>TCP, UDP</td>
<td>111, 2049</td>
<td>Standard NFS ports used as a transmission channel from the Veeam Agent for Linux computer to the target NFS share.</td>
</tr>
</tbody>
</table>

## Communication with Veeam Backup & Replication Repositories

<table>
<thead>
<tr>
<th>From</th>
<th>To</th>
<th>Protocol</th>
<th>Port</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Veeam Agent computer</td>
<td>Linux server performing the role of a backup repository</td>
<td>TCP</td>
<td>2500 to 3300</td>
<td>Default range of ports used as data transmission channels. For every TCP connection that a job uses, one port from this range is assigned.</td>
</tr>
<tr>
<td></td>
<td>Microsoft Windows server performing the role of a backup repository</td>
<td>TCP</td>
<td>49152 to 65535 (for Microsoft Windows 2008 and newer)</td>
<td>Dynamic RPC port range. For more information, see <a href="#">this Microsoft article</a>.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>TCP</td>
<td>2500 to 3300</td>
<td>Default range of ports used as data transmission channels. For every TCP connection that a job uses, one port from this range is assigned.</td>
</tr>
</tbody>
</table>

## Communication with Veeam Cloud Connect Repositories

<table>
<thead>
<tr>
<th>From</th>
<th>To</th>
<th>Protocol</th>
<th>Port</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Veeam Agent computer</td>
<td>Cloud gateway</td>
<td>TCP</td>
<td>6180</td>
<td>Port on the cloud gateway used to transport Veeam Agent data to the Veeam Cloud Connect repository.</td>
</tr>
<tr>
<td>From</td>
<td>To</td>
<td>Protocol</td>
<td>Port</td>
<td>Notes</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------------------</td>
<td>----------</td>
<td>------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Certificate Revocation Lists</td>
<td>TCP</td>
<td>TCP</td>
<td>80 or 443 (most popular)</td>
<td>Veeam Agent computer needs access to CRLs (Certificate Revocation Lists) of the CA (Certification Authority) who issued a certificate to the Veeam Cloud Connect service provider. Generally, information about CRL locations can be found on the CA website.</td>
</tr>
</tbody>
</table>

**IMPORTANT!**

The list of ports required for computers booted from the Veeam Recovery Media is the same as the list of ports required for Veeam Agent computers.
Installation and Configuration

You can install Veeam Agent for Linux on any Linux-based endpoint whose data you plan to protect — virtual machine or physical device (server, desktop or laptop).
Before You Begin

Before you start the installation process, check the following prerequisites:

1. The computer on which you plan to install Veeam Agent for Linux must satisfy system requirements specified in this document. To learn more, see System Requirements.

2. To install Veeam Agent for Linux software packages, you must use the root account or any user account that has super user (root) privileges on the computer where you plan to install the product.

3. Veeam Agent for Linux software packages have the following dependencies:
   - `lvm2` — required by the veeamconfig package to support operations with LVM volumes.
   - `dkms` — required by the veeamsnap package for building the kernel module for Veeam Agent for Linux Driver.
     
     This dependency does not apply to CentOS, RHEL and SLES distributions. For these distributions, there is no need to build the veeamsnap kernel module with dkms. Instead, you can install it from a pre-built binary package provided by Veeam. To learn more, see Installing Veeam Agent for Linux.

     If the required components are not pre-installed on the computer, you will be asked to install them during or after the product installation process (depending on the package manager you use). To learn more, see Managing Package Dependencies.

     For the full list of packages required for product operation, see System Requirements.

4. If you have used the Beta version of Veeam Agent for Linux, you must remove Veeam Agent for Linux software packages prior to installing the release version of the product. To learn more, see Uninstalling Veeam Agent for Linux.
Installing Veeam Agent for Linux

NOTE:
To make UEFI systems with Secure Boot work with the pre-built veeamsnap kernel module, you need to enroll the Veeam public key to the MOK list using the mokutil utility. The key is available in the veeamsnap-ueficert-5.0.0.4318-1.noarch package residing on the Veeam repository. To enroll the key:

1. Request the enrollment of the public key with the following command: mokutil --import veeamsnap-ueficert.crt.
2. Reboot the Veeam Agent computer and complete the enrollment in the UEFI console.

To install Veeam Agent for Linux:

1. Download the Veeam software repository installation package (veeam-release) from the Veeam Download page, and save the downloaded package on the computer where you plan to install the product.

   TIP: If the computer where you want to install Veeam Agent for Linux is not connected to the internet, you can download and install Veeam Agent for Linux packages manually. To learn more, see Installing Veeam Agent for Linux in Offline Mode.

2. Navigate to the directory where you have saved the veeam-release package and install the package with the following commands:

   For CentOS / RHEL / Oracle Linux / Fedora
   
   ```
   rpm -ivh ./veeam-release* && yum check-update
   ```

   For openSUSE / SLES

   ```
   zypper in ./veeam-release* && zypper refresh
   ```

   For Debian / Ubuntu

   ```
   dpkg -i ./veeam-release* && apt-get update
   ```

3. Install Veeam Agent for Linux packages from the Veeam software repository. To install Veeam Agent for Linux, you can use a package manager of your choice that works with software packages in your Linux distribution. For example, use the following commands:

   For CentOS / RHEL / Fedora

   ```
   yum install veeam
   ```
NOTE:

[For CentOS / RHEL] If the dkms package was installed in the OS prior to the time when you install Veeam Agent, to install the product, use the following command: yum install kmod-veeamsnap veeam. With this command, the veeamsnap kernel module will be installed from the binary kmod-veeamsnap package. Otherwise, the veeamsnap module will be installed from the source RPM package using dkms.

For Oracle Linux

```bash
yum install veeamsnap
yum install veeam
```

For openSUSE Tumbleweed

```bash
zypper in veeam
```

For openSUSE Leap 15.2

```bash
zypper in veeamsnap-kmp-default
zypper in veeam
```

For SLES with Default kernel

```bash
zypper in veeamsnap-kmp-default
zypper in veeam
```

For SLES with Trace kernel

```bash
zypper in veeamsnap-kmp-trace
zypper in veeam
```

For SLES with Xen kernel

```bash
zypper in veeamsnap-kmp-xen
zypper in veeam
```

For SLES with PAE kernel

```bash
zypper in veeamsnap-kmp-pae
zypper in veeam
```

For SLES with Preempt kernel

```bash
zypper in veeamsnap-kmp-preempt
zypper in veeam
```

For Debian / Ubuntu
apt-get install veeam

**IMPORTANT!**

Ubuntu 20.04 and 20.10 on kernel version 5.8 or later require the `veeam-nosnap_5.0.0.4318_amd64.deb` package instead of the default package and does not require the `veeamsnap` package.

### Managing Package Dependencies

The following dependency packages may require special handling in case you see installation errors:

- **The `dkms` package** is not present in default repositories for some Linux distributions. You should obtain it from third-party repositories:
  - EPEL repository (for CentOS / RHEL / Oracle Linux / Fedora)
  - Packman repository (for openSUSE). To learn more, see [Installing dkms in openSUSE](#).
  
  For SLES, the `dkms` package is not available in the Packman repository. You must use the package intended for openSUSE. To learn more, see [this Veeam KB article](#).

- **Extended kernels**, such as `kernel-pae`, `kernel-uek` and other, require appropriate `kernel-devel` packages to be installed, for example, `kernel-pae-devel`, `kernel-uek-devel`, and so on.

  Version of the `kernel-devel` package must match your current kernel version. To check your current kernel version, run the `uname -r` command.

  [For RHEL and derivatives] If the `yum` package manager installs packages that do not match your current kernel version, you should either update your system or fetch older versions of the required packages from the CentOS Vault repository.

### Installing dkms in openSUSE

In openSUSE systems, while installing the `dkms` package, you may see an error similar to the following:

```
Problem: nothing provides kernel-devel needed by dkms-2.2.0.3-14.1.noarch
Solution 1: do not install dkms-2.2.0.3-14.1.noarch
Solution 2: break dkms-2.2.0.3-14.1.noarch by ignoring some of its dependencies
```

To install the `dkms` package, do the following:

1. **Make sure that you have an appropriate `kernel-devel` package installed and its version matches your kernel version.** For example:

   ```
   root@localhost:~> rpm -qa | grep kernel-default
   kernel-default-devel-3.0.101-91.1
   kernel-default-3.0.101-91.1
   ```
2. Install the `dkms` package ignoring dependencies:

   
   `zypper -n install --force dkms`

3. Make sure that you have allowed unsupported modules. To learn more, see this SUSE webpage.
Installing Veeam Agent for Linux in Offline Mode

If a computer where you want to install Veeam Agent for Linux has no connection to the internet, for example, for security reasons, you can install Veeam Agent for Linux in the offline mode. In this scenario, you do not need to download and install the Veeam software repository installation package (veeam-release). Instead, you need to download the entire Veeam Agent for Linux packages from the Veeam software repository and install them on the target computer.

To install Veeam Agent for Linux:

1. On a computer that is connected to the internet, download Veeam Agent packages intended for your Linux distribution from the Veeam software repository.
2. Save Veeam Agent packages to a directory that can be accessed from the computer where you want to install the product, for example, a directory on a local drive or USB drive, or a network shared folder.
3. On the computer where you want to install Veeam Agent, navigate to the directory where you have saved the packages and install Veeam Agent:
   - Installing Veeam Agent for Linux in CentOS / RHEL
   - Installing Veeam Agent for Linux in Oracle Linux
   - Installing Veeam Agent for Linux in Fedora
   - Installing Veeam Agent for Linux in SLES
   - Installing Veeam Agent for Linux in openSUSE
   - Installing Veeam Agent for Linux in Debian / Ubuntu

TIP:

You can also set up a local mirror of the Veeam software repository in your internal network and add this repository to the list of software sources on a computer where you want to install the product. These operations may differ depending on the Linux distribution and package manager that you use. To learn more, refer to the documentation of your Linux distribution.

After you add a local repository to the list of software sources on a computer, you will be able to install and upgrade Veeam Agent for Linux in a regular way. To learn more, see Installing Veeam Agent for Linux and Upgrading Veeam Agent for Linux.

Installing Veeam Agent for Linux in CentOS / RHEL

To install Veeam Agent for Linux, use the following commands:

For 32-bit RHEL 6

```
rpm -i <...>/kmod-veeamsnap-5.0.0.4318-2.6.32_131.0.15.el6.i386.rpm
rpm -i <...>/veeam-5.0.0.4318-1.el6.i386.rpm
```
For 64-bit RHEL 6

```
rpm -i <...>/kmod-veeamsnap-5.0.0.4318-2.6.32_131.0.15.el6.x86_64.rpm
rpm -i <...>/veeam-5.0.0.4318-1.el6.x86_64.rpm
```

For 32-bit CentOS 7 / RHEL 7

```
rpm -i <...>/veeamsnap-5.0.0.4318-1.noarch.rpm
rpm -i <...>/veeam-5.0.0.4318-1.el7.i386.rpm
```

For 64-bit CentOS 7 / RHEL 7

```
rpm -i <...>/kmod-veeamsnap-5.0.0.4318-1.el7.x86_64.rpm
rpm -i <...>/veeam-5.0.0.4318-1.el7.x86_64.rpm
```

For 32-bit CentOS 8 / RHEL 8

```
rpm -i <...>/veeamsnap-5.0.0.4318-1.noarch.rpm
rpm -i <...>/veeam-5.0.0.4318-1.el8.i386.rpm
```

For 64-bit CentOS 8 / RHEL 8

```
rpm -i <...>/kmod-veeamsnap-5.0.0.4318-4.18.0_80.el8.x86_64.rpm
rpm -i <...>/veeam-5.0.0.4318-1.el8.x86_64.rpm
```

where:
<...> — path to a directory where you have saved Veeam Agent packages.

**NOTE:**
The pre-built `veeamsnap` binaries require kernel 2.6.32-131.0.15 or later for RHEL 6 (excluding 2.6.32-279.el6.i686) and kernel 3.10.0-123 or later for CentOS / RHEL 7.0 - 7.7 to operate.

### Installing Veeam Agent for Linux in Oracle Linux

To install Veeam Agent for Linux, use the following commands:

**For 32-bit Oracle Linux 7**

```
rpm -i <...>/veeamsnap-5.0.0.4318-1.noarch.rpm
rpm -i <...>/veeam-5.0.0.4318-1.el7.i386.rpm
```
Installing Veeam Agent for Linux in Fedora

To install Veeam Agent for Linux, use the following commands:

For 32-bit Fedora 32

```
rpm -i <...>/veeamsnap-5.0.0.4318-1.noarch.rpm
rpm -i <...>/veeam-5.0.0.4318-1.fc24.i386.rpm
```

For 64-bit Fedora 32

```
rpm -i <...>/veeamsnap-5.0.0.4318-1.noarch.rpm
rpm -i <...>/veeam-5.0.0.4318-1.fc24.x86_64.rpm
```

where:

<...> — path to a directory where you have saved Veeam Agent packages.

Installing Veeam Agent for Linux in SLES

**NOTE:**

If you use a Trace, Xen, PAE, or preempt kernel, you need to choose the corresponding `veeamsnap` package for installation instead of the default one, for example, `veeamsnap-kmp-trace-5.0.0.4318_3.0.101_63-2.1.i586.rpm` instead of `veeamsnap-kmp-default-5.0.0.4318_3.0.101_63-2.1.i586.rpm`.

To install Veeam Agent for Linux, use the following commands:
For 32-bit SLES 11 SP4

```
zypper in <...>/veeamsnap-kmp-default-5.0.0.4318_3.0.101_63-2.1.i586.rpm
zypper in <...>/veeam-5.0.0.4318-1.sles11.i386.rpm
```

For 64-bit SLES 11 SP4

```
zypper in <...>/veeamsnap-kmp-default-5.0.0.4318_3.0.101_63-2.1.x86_64.rpm
zypper in <...>/veeam-5.0.0.4318-1.sles11.x86_64.rpm
```

For 64-bit SLES 12 SP1

```
zypper in <...>/veeamsnap-kmp-default-5.0.0.4318_k3.12.49_11-2.1.x86_64.rpm
zypper in <...>/veeam-5.0.0.4318-1.sles12.x86_64.rpm
```

For 64-bit SLES 12 SP2

```
zypper in <...>/veeamsnap-kmp-default-5.0.0.4318_k4.4.21_69-2.1.x86_64.rpm
zypper in <...>/veeam-5.0.0.4318-1.sles12.x86_64.rpm
```

For 64-bit SLES 12 SP3

```
zypper in <...>/veeamsnap-kmp-default-5.0.0.4318_k4.4.73_5-2.1.x86_64.rpm
zypper in <...>/veeam-5.0.0.4318-1.sles12.x86_64.rpm
```

For 64-bit SLES 12 SP4

```
zypper in <...>/veeamsnap-kmp-default-5.0.0.4318_k4.12.14_94.41-2.1.x86_64.rpm
zypper in <...>/veeam-5.0.0.4318-1.sles12.x86_64.rpm
```

For 64-bit SLES 12 SP5

```
zypper in <...>/veeamsnap-kmp-default-5.0.0.4318_k4.12.14_120-2.x86_64
zypper in <...>/veeam-5.0.0.4318-1.sles12.x86_64.rpm
```

For 64-bit SLES 15 SP0

```
zypper in <...>/veeamsnap-kmp-default-5.0.0.4318_k4.12.14_23-2.1.x86_64
zypper in <...>/veeam-5.0.0.4318-1.sles12.x86_64.rpm
```

For 64-bit SLES 15 SP1

```
zypper in <...>/veeamsnap-kmp-default-5.0.0.4318_k4.12.14_195-2.1.x86_64.rpm
zypper in <...>/veeam-5.0.0.4318-1.sles12.x86_64.rpm
```
Installing Veeam Agent for Linux in openSUSE

To install Veeam Agent for Linux, use the following commands:

For 32-bit openSUSE Tumbleweed

zypper in <...>/veeamsnap-5.0.0.4318-1.noarch.rpm
zypper in <...>/veeam-5.0.0.4318-1.suse.i386.rpm

For 64-bit openSUSE Tumbleweed

zypper in <...>/veeamsnap-5.0.0.4318-1.noarch.rpm
zypper in <...>/veeam-5.0.0.4318-1.suse.x86_64.rpm

For 64-bit openSUSE Leap 15.2

zypper in <...>/veeamsnap-kmp-default-5.0.0.4318_k5.3.18_lp152.19-2.x86_64.rpm
zypper in <...>/veeam-5.0.0.4318-1.suse.x86_64.rpm

where:

<...> — path to a directory where you have saved Veeam Agent packages.

Installing Veeam Agent for Linux in Debian / Ubuntu

To install Veeam Agent for Linux, use the following commands:

For 32-bit Debian / Ubuntu 14.04, 16.04, 18.04

dpkg -i <...>/veeamsnap_5.0.0.4318_all.deb
dpkg -i <...>/veeam_5.0.0.4318_i386.deb

For 64-bit Debian / Ubuntu 14.04, 16.04, 18.04

dpkg -i <...>/veeamsnap_5.0.0.4318_all.deb
dpkg -i <...>/veeam_5.0.0.4318_amd64.deb
For 32-bit Ubuntu 20.04, 20.10

```
dpkg -i <...>/veeam-nosnap_5.0.0.4318_i386
```

For 64-bit Ubuntu 20.04, 20.10

```
dpkg -i <...>/veeam-nosnap_5.0.0.4318_amd64
```

where:

<...> — path to a directory where you have saved Veeam Agent packages.
Upgrading Veeam Agent for Linux

For Veeam Agent for Linux, upgrade to newer versions is supported. You can start the upgrade process when the new version becomes available.

During the upgrade process, configuration and backup files that were created with the previous version of Veeam Agent are not impacted in any way.

**IMPORTANT!**
Before starting the upgrade process, make sure that there are no jobs running on the Veeam Agent computer.

The upgrade procedure differs depending on the Linux distribution that you use:

- **Upgrading Veeam Agent for Linux in CentOS / RHEL**
- **Upgrading Veeam Agent for Linux in Fedora / Oracle Linux**
- **Upgrading Veeam Agent for Linux in openSUSE**
- **Upgrading Veeam Agent for Linux in SLES 11 SP4**
- **Upgrading Veeam Agent for Linux in SLES 12 SP1 – SLES 15 SP2**
- **Upgrading Veeam Agent for Linux in Debian / Ubuntu**

### Upgrading Veeam Agent for Linux in CentOS / RHEL

To upgrade Veeam Agent for Linux, use the following commands:

```bash
yum update veeam
rpm -e --nodeps dkms veeamsnap
yum install kmod-veeamsnap*
```

or

```bash
yum install kmod-veeamsnap*
yum update veeam
rpm -e dkms veeamsnap
```

With these commands, a pre-built `veeamsnap` binary package will be installed in your system. To stay on the DKMS version of the `veeamsnap` kernel module, use the following command for upgrade:

```bash
yum update veeamsnap && yum update veeam
```
Upgrading Veeam Agent for Linux in Fedora / Oracle Linux

To upgrade Veeam Agent for Linux, use the following command:

```
yum update veeam
```

Upgrading Veeam Agent for Linux in openSUSE

To upgrade Veeam Agent for Linux, use the following commands:

For openSUSE Tumbleweed

```
zypper up veeam
```

For openSUSE Leap 15.2

```
zypper in veeamsnap-kmp-default-5.0.0.4318_k5.3.18_l152.19-2
zypper in --force veeamsnap-kmp-default-5.0.0.4318_k5.3.18_l152.19-2.x86_64
```

With these commands, a pre-built veeamsnap binary package will be installed in your system. The --force key is required to properly replace the missing link to .ko in case of update from the DKMS version of the veeamsnap kernel module to a pre-built binary. To stay on the DKMS version, use the following command for upgrade:

```
zypper update veeam
```

Upgrading Veeam Agent for Linux in SLES 11 SP4

To upgrade Veeam Agent for Linux, use the following commands:

For Default kernel

```
zypper in veeamsnap-kmp-default
zypper in --force veeamsnap-kmp-default
```

For Xen kernel

```
zypper in veeamsnap-kmp-xen
zypper in --force veeamsnap-kmp-xe
```

For Trace kernel

```
zypper in veeamsnap-kmp-trace
zypper in --force veeamsnap-kmp-trace
```
For PAE kernel

```
zypper in veeamsnap-kmp-pae
zypper in --force veeamsnap-kmp-pae
```

With these commands, a pre-built `veeamsnap` binary package will be installed in your system. The `--force` key is required to properly replace the missing link to `.ko` in case of update from the DKMS version of the `veeamsnap` module to a pre-built binary. To stay on the DKMS version, use the following command for upgrade:

```
zypper update veeam
```

Upgrading Veeam Agent for Linux in SLES 12 SP1 – SLES 15 SP2

To upgrade Veeam Agent for Linux:

1. Download the Veeam software repository installation package (`veeam-release`) from the Veeam Download page, and save the downloaded package on the computer where you plan to install the product.

2. Install the Veeam software repository installation package with the following command:

   ```
   zypper in ./veeam-release* && zypper refresh
   ```

3. Upgrade Veeam Agent for Linux with the following commands:

   **For Default kernel**

   ```
   zypper in veeamsnap-kmp-default
   zypper in --force veeamsnap-kmp-default
   ```

   **For Xen kernel**

   ```
   zypper in veeamsnap-kmp-xen
   zypper in --force veeamsnap-kmp-xen
   ```

   With these commands, a pre-built `veeamsnap` binary package will be installed in your system. The `--force` key is required to properly replace the missing link to `.ko` in case of update from the DKMS version of the `veeamsnap` module to a pre-built binary. To stay on the DKMS version, use the following command for upgrade:

   ```
   zypper update veeam
   ```
Upgrading Veeam Agent for Linux in Debian / Ubuntu

To upgrade Veeam Agent for Linux, use the following commands:

```
apt-get update
apt-get install veeam
```
Granting Permissions to Users

When you install Veeam Agent for Linux, the product program files are placed to the folders on the system volume. For full access to Veeam Agent files, super user (root) privileges are required. Rights to execute product files and run commands are also granted to users that belong to the veeam group.

The veeam group is automatically created by Veeam Agent at the process of the product installation. To let regular users work with Veeam Agent without the need to gain root privileges, you can add the necessary users to this group. Users in the veeam group will be able to execute Veeam Agent commands and perform backup and restore tasks under regular user account.

To add a user to the veeam group, in most of Linux distributions you can use the following command:

```
usermod -a -G veeam <username>
```

where:

<username> — name of the account to which you want to grant access to Veeam Agent.

For example:

```
root@srv01:~# usermod -a -G veeam user
```

**IMPORTANT!**

Consider the following:

- To add a user to the veeam group, you must have super user (root) privileges in the Linux OS.
- After the user is added to the veeam group, the user must re-login to the Linux OS.
- Add only trusted users to the veeam group. Veeam Agent for Linux daemon runs and executes commands and scripts with the super user privileges. Thus, users who belong to this group can potentially escalate their privileges through the creative use of pre-freeze/post-thaw or pre-job/post-job scripts.

To check whether the user who is currently logged in to the Linux OS is added to the veeam group, you can use the following command:

```
groups
```

For example:

```
user@srv01:~$ groups
user adm cdrom sudo dip plugdev lpadmin sambashare veeam
```
Performing Initial Setup

After you install Veeam Agent for Linux, you can use the Veeam Agent for Linux control panel to perform initial product setup. When you launch the control panel for the first time, Veeam Agent displays the initial setup wizard. The wizard offers you to accept license agreements, install a license and create a custom Veeam Recovery Media that will include drivers of your Veeam Agent computer.

To perform initial setup, launch the Veeam Agent control panel with the veeam or veeamconfig ui command. Then use the initial setup wizard to complete the following steps:

1. Accept Veeam and third-party license agreements.
2. Create a custom Veeam Recovery Media.
3. Install a license.
Step 1. Accept License Agreements

At the **Agreements** step of the initial setup wizard, accept the terms of the product license agreement and license agreements for third-party components of the product. You must accept the license agreements to start using the product. Until you accept the license agreements, you will not be able to perform backup and data recovery tasks with the Veeam Agent for Linux control panel and command line interface.

To accept the license agreements:

1. Make sure that the **I accept the terms of the Veeam license agreement** option is selected and press **Space**.
2. Select the **I accept the terms of the 3rd party components license agreements** option with the **Down** or **Tab** key and press **Space**.
3. Press **Enter**.
Step 2. Create Custom Veeam Recovery Media

At the **Recovery ISO** step of the initial setup wizard, specify settings for the custom Veeam Recovery Media.

In addition to the generic Veeam Recovery Media that is available for download at the Veeam website, you can create a custom Veeam Recovery Media. This option may be helpful if your computer uses hardware that requires drivers not included in the generic Veeam Recovery Media. When you create the custom Veeam Recovery Media, Veeam Agent for Linux copies the Linux kernel running on your computer with its currently loaded modules and includes them into the custom recovery media.

Before you create the custom Veeam Recovery Media, check the following prerequisites:

- The Linux system must have the `genisoimage` package installed. For openSUSE and SLES 15 SP0 – SP1 distributions, the Linux system must have the `mkisofs` package installed instead.

- If you plan to create the custom Veeam Recovery Media with EFI support, the Linux system must also have the following packages installed:
  - xorriso
  - isolinux (or `syslinux`, if the software package repository of your Linux distribution lacks the `isolinux` package)

**TIP:**

If you do not want to create a custom Veeam Recovery Media at the process of initial product setup, switch to the **Next** button with the **Tab** key and press **Enter**. You will proceed immediately to the **License** step of the initial setup wizard.

You can create the custom Veeam Recovery Media later, at any time you need, using the Veeam Agent for Linux command line interface. To learn more, see **Creating Custom Veeam Recovery Media**.

To specify settings for the custom Veeam Recovery Media:

1. Make sure that the **Patch Veeam Recovery Media ISO** option is selected and press **Space**.

2. If you want the Veeam Recovery Media to be able to boot on EFI-based systems, select the **EFI system** option with the **Tab** key and press **Space**.

   If you do not enable this option, the custom Veeam Recovery Media will be able to boot on BIOS-based systems only.

3. Press **Tab** and select how you want to create a custom Veeam Recovery Media depending on the location of the generic recovery media ISO file:

   a. If you did not download the generic Veeam Recovery Media from the Veeam website, make sure that the **Download and patch ISO** option is selected and press **Tab**. When you start the custom recovery media creation process, Veeam Agent for Linux will download the ISO file of the generic Veeam Recovery Media from the Veeam software repository to the `/tmp/veeam` directory on the Veeam Agent computer and use this image to create the custom Veeam Recovery Media.

   The size of the downloaded Veeam Recovery Media ISO file depends on the Veeam Agent computer architecture: 108 MB for x86 and 116 MB for x64.

   b. If you have already downloaded the recovery media ISO to a local directory on the Veeam Agent computer or to a network shared folder, select the **Patch local ISO** option with the **Down** key and press **Tab**. If you select this option, you will be able to specify a path to the ISO file of the generic Veeam Recovery Media.
4. If you have selected the **Patch local ISO** option, in the **Path to ISO** field, specify a path to the ISO file of the generic Veeam Recovery Media:
   a. Select the **Browse** option with the **Tab** key and press **Enter**.
   b. In the **Saved patched ISO to** window, select the necessary directory and press **Enter**.
   c. Repeat the step 'b' until a path to the directory in which the recovery media ISO file resides appears in the **Current directory** field.
   d. In the directory where the recovery media ISO file resides, select the ISO file and press **Enter**.

5. In the **Save patched ISO to** field, specify a path to the resulting ISO file of the custom Veeam Recovery Media:
   a. Select the **Browse** option with the **Tab** key and press **Enter**.
   b. In the **Saved patched ISO to** window, select the necessary directory and press **Enter**.
   c. Repeat the step 'b' until a path to the directory where you want to save the resulting custom recovery media ISO file appears in the **Current directory** field.
   d. Select the **OK** button with the **Tab** key and press **Enter**.

6. To start the custom recovery media creation process, select the **Next** button with the **Tab** key and press **Enter**.
Step 3. Install Product License

At the License step of the initial setup wizard, install the license. You can choose to install the license immediately or postpone this operation.

- If you choose to install the license, you can immediately browse for the license key on your computer and complete the license installation process.
- If you choose to postpone the license installation process, you will be able to install a license later at any time you need.

Until you install a license, Veeam Agent for Linux will operate in the Free edition. To learn more, see Product Editions.

**NOTE:**
If you choose not to install a license and use Veeam Agent in the Free edition, Veeam Agent will display a notification offering to install a license every time you open the control panel. The notification will appear in the control panel until Veeam Agent completes the first backup job session.

To install a license:

1. In the **File location** field, specify a path to the license key:
   a. Select the **Browse** option with the **Tab** key and press **Enter**.
   b. In the **Choose license file location** window, select the necessary directory and press **Enter**.
   c. Repeat the step 'a' until a path to the directory in which the license key resides appears in the **Current directory** field.
   d. In the directory where the license key resides, select the license key and press **Enter**.

2. In the **Choose agent edition to use on this computer** section, select the product edition in which Veeam Agent will operate and press **Enter** to install the license and finish working with the initial setup wizard.

**TIP:**
Consider the following:

- If you do not want to install a license, to finish working with the initial setup wizard, switch to the **Finish** button with the **Tab** key and press **Enter**.
- You can view information about the installed license (expiration date, status of the license, current edition of the product and so on) in the Veeam Agent control panel or using the Veeam Agent command line interface. To learn more, see Viewing License.
Provide license file for Veeam Agent for Linux

<table>
<thead>
<tr>
<th>Agreements</th>
<th>File location: veeam/license.lic</th>
<th>[Browse]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recovery</td>
<td></td>

Choose agent edition to use on this computer:

( ) Workstation

(✓) Server

If you do not have a license, then just click [Finish] and the product will operate in Free Edition mode.

[Prev] [Finish] [Cancel]
Configuring Advanced Settings

HTTP Proxy Settings

If you want to use Veeam Agent for Linux to back up your data to a Veeam Cloud Connect repository, it might be required that you specify HTTP proxy settings for Veeam Agent.

Veeam Agent computer needs access to CRLs (Certificate Revocation Lists) of the CA (Certification Authority) who issued a certificate to the Veeam Cloud Connect service provider. In case it is not possible to establish a direct connection to CRLs, you must configure an HTTP proxy and specify settings to connect to the proxy in Veeam Agent.

To specify settings for an HTTP proxy, uncomment and edit the following lines in the [cloudconnect] section of the /etc/veeam/veeam.ini configuration file:

```
[cloudconnect]
...
# httpproxylogin= <username>
...
# httpproxypasswd= <password>
...
# httpproxyurl= <URL>
```

where:

- `<username>` — name of the account used to connect to the HTTP proxy.
- `<password>` — password of the account used to connect to the HTTP proxy.
- `<URL>` — URL of a proxy used for CRL checks.

**NOTE:**

If the proxy does not require authentication, you do not need to specify the account name and password. Keep in mind that only the basic authentication method is supported for connection to a proxy.

For example:

```
[cloudconnect]
...
# HTTP proxy login
httpproxylogin= user01
# HTTP proxy password
httpproxypasswd= P@ssw0rd
# HTTP proxy URL for CRL checks
httpproxyurl= http://proxy.company.lan:3128
```
Uninstalling Veeam Agent for Linux

To uninstall Veeam Agent for Linux, you need to remove the `veeam` and `veeamsnap` packages. For this operation, you can use any package manager that works with software packages in your Linux distribution.

The following examples show commands to uninstall Veeam Agent:

**For CentOS / RHEL / Oracle Linux / Fedora**

```
yum remove veeam veeamsnap
```

**For openSUSE / SLES**

```
zypper rm veeam veeamsnap
```

**For Debian / Ubuntu**

```
apt-get remove veeam veeamsnap
```
Getting Started

To protect your computer from a disaster of any kind, you must perform the following operations in Veeam Agent for Linux:

1. **Define what data you want to back up and configure the backup job.**
   
   Before you configure the backup job, you should decide on the following backup details:
   
   - **Backup destination:** where you want to store your backed-up data.
   - **Backup scope:** entire computer image, individual computer volumes or specific computer folders and files.
   - **Backup schedule:** how often you want to back up your data.

   After that, you can configure one or several backup jobs. The backup job captures the data that you have added to the backup scope and creates a chain of restore points in the target location. If your data gets lost or corrupted, you can restore it from the necessary restore point.

   In Veeam Agent, you can configure the backup job in one of the following ways:
   
   - **With the Backup Job wizard**
   - **With the command line interface**

2. **Monitor backup task performance.**

   You can use the Veeam Agent Control Panel to check how backup tasks are being performed, what errors have occurred during backup job sessions and so on. You can also use Veeam Agent command line interface to get information on backup and restore sessions status and view session logs. To learn more, see Reporting.

3. In case of a disaster, you can **restore the entire computer image or specific data** on the computer. With Veeam Agent, you can perform data recovery operations in several ways:
   
   - You can boot from the Veeam Recovery Media and perform volume-level restore or file-level restore.
   - You can perform volume-level restore with Veeam Agent command line interface.
   - You can perform file-level restore with the Veeam Agent File Level Restore wizard.
   - You can export backup to a VHD virtual disk and attach this disk to a virtual machine to recover your computer in virtual environment.

   To learn more, see Performing Restore.
Getting to Know User Interface

With Veeam Agent for Linux, you can perform backup, restore and configuration tasks in the following ways:

- **With Veeam Agent control panel**

  Veeam Agent control panel is a GUI-like user interface based on the `ncurses` programming library. With Veeam Agent control panel, you can perform all basic data protection tasks. You can configure a backup job, start and stop backup jobs, monitor backup job session performance and recover files and folders. When you perform restore tasks after booting from the Veeam Recovery Media, you can also perform volume-level restore with the Veeam Recovery Media wizard.

- **With the command line interface**

  With Veeam Agent command line interface, in addition to operations that can be performed with the Veeam Agent control panel, you can perform a set of advanced tasks. For example, you can:
  
  - Configure advanced settings for backup jobs: specify compression level and data block size.
  - Perform operations with backup repositories.
  - Perform volume-level restore without the need to boot from the Veeam Recovery Media.
  - Export backups to VHD virtual disks.
  - Monitor performance and status of any backup, restore and other data transfer session that was started in Veeam Agent.
  - View detailed information on every backup that was created with Veeam Agent.
  - Export/import Veeam Agent configuration database to/from a configuration file.
Veeam Agent for Linux Control Panel

Veeam Agent for Linux control panel is a GUI-like user interface that lets users perform main backup and restore tasks in an easy way. With Veeam Agent for Linux control panel, you do not need to work with Linux shell and remember numerous commands. However, some advanced Veeam Agent for Linux operations are not supported by the control panel and can be performed with the command line interface only.

IMPORTANT!
You cannot use Veeam Agent for Linux control panel on terminals that do not support colors (for example, VT100).

To launch the Veeam Agent for Linux control panel, you can use the following commands:

```
veeamconfig ui
```

or

```
veeam
```

NOTE:
Veeam Agent for Linux control panel is based on the ncurses programming library. To use the Veeam Agent for Linux control panel, you must have the ncurses library installed in your Linux OS. To learn more, see System Requirements.

When you launch the Veeam Agent for Linux control panel for the first time, Veeam Agent for Linux offers you to perform initial product setup. To learn more, see Performing Initial Setup.

After you perform initial product setup, before you configure the first backup job, you can use the Veeam Agent for Linux control panel to perform the following operations:

- Configure a new backup job.
- Restore files and folders from existing backup.
- Manage license and product logs.

After you configure one or several backup jobs, you can also use the control panel to start a backup job and work with backup job sessions.

Navigating Veeam Agent for Linux Control Panel

In the Veeam Agent for Linux control panel, the use of a mouse is not supported. To start an operation, you need to use a specific key on your keyboard. For example, you can press the 'c' key to start the backup job configuration, press the 's' key to start a backup job or press the 'r' key to start the file-level restore process. Short help information on the currently available operations and keys is displayed at the bottom of the control panel.

To navigate the control panel, backup job configuration and file-level restore wizards, you can use the following keys:

- Tab — to switch between controls and buttons in the Backup Job wizard.
• **Up** and **Down** — to switch between items in a scrollable list.

• **Space** — to select the necessary item in a list. The selected item's mark may vary in different steps of the wizard.

• **Enter** — to proceed to the next step of a wizard or to view details of the backup job session selected in the list of sessions.

• **Backspace** — to return to the previous step of a wizard (you cannot use this button to change wizard steps when a text field is selected).

• **Esc** — to exit the currently used wizard or close the Veeam Agent for Linux control panel.

---

Thank you for installing our product!

As the first step, you will need to configure a backup job. You can choose between backing up the entire computer, individual volumes or select files and directories only. In any case, we will create an image-level backup containing the selected data. Press [C] to create your first backup job now.

If you already have any type of backup created and want to perform a restore of individual files, press [R] now. To restore the entire computer or an individual volume, you will need to boot from Veeam Recovery Media first.

Need help? Check out Veeam Agent for Linux forum at https://forums.veeam.com
Command Line Interface

Veeam Agent command line interface is a powerful tool that lets users perform advanced operations that are not supported by the Veeam Agent control panel.

To work with Veeam Agent using command line interface, you can use a terminal console (TTY) or a terminal emulator of your choice. All tasks in Veeam Agent are performed with the `veeamconfig` command-line utility. To perform tasks with Veeam Agent, you should construct the necessary command and type it in the Linux shell prompt.

You can view short help information on every Veeam Agent command at any time you need. To learn more, see Viewing Help.

You should construct a command in the following format:

```
veeamconfig <command_1> <command_2> --<parameter_1> --<parameter_2> --<parameter_n>
```

where:

- `<command_1>` -- command that defines a type of an object with which you want to perform a task. Currently, the following commands are available in Veeam Agent:
  - `aap`
  - `agreement`
  - `backup`
  - `cloud`
  - `config`
  - `grablogs`
  - `help`
  - `job`
  - `license`
  - `mode`
  - `patchiso`
  - `point`
  - `repository`
  - `schedule`
  - `session`
  - `ui`
  - `version`
  - `vbrserver`
- `<command_2>` — command that defines a task that you want to perform with an object of the specified type. For example, you can perform the following commands with backup repositories:
  - create
  - delete
  - edit
  - help
  - list
  - rescan

- `<parameter_1>, <parameter_2>, <parameter_n>` — parameters for the command that you want to execute. Commands may require one or several mandatory or optional parameters. Some commands, for example, `veeamconfig ui` and `veeamconfig [<command>] help` do not require parameters.

The following example shows the command that displays a list of backup repositories configured in Veeam Agent and the output of this command:

<table>
<thead>
<tr>
<th>Name</th>
<th>ID</th>
<th>Location</th>
<th>Typ</th>
</tr>
</thead>
<tbody>
<tr>
<td>Backup server</td>

</tr>
</tbody>
</table>

user@srv01:~$ veeamconfig repository list
Name          ID                                      Location            Typ
Backup server 818e3a0f-8155-4a51-9430-248a203a43d1 /home/backups local
Repository_1  2155a2e7-a1e9-4347-9d8b-cf8f3a6f3fcb 172.17.53.47/veeam
Viewing Help

You can view short help information on the specific Veeam Agent command. To view help, use the following command:

```
veeamconfig <command> help
```

where:

<command> — name of the command for which you want to view help information.

For example:

```
user@srv01:~$ veeamconfig help
```

or

```
user@srv01:~$ veeamconfig job help
```

or

```
user@srv01:~$ veeamconfig job create help
```

You can also view the manual page for the `veeamconfig` utility. Use the following command:

```
man veeamconfig
```
Licensing

To work with Veeam Agent, you must accept terms of the product license agreement and license agreements for third-party components operating as part of the product.

If you want to use a commercial version of Veeam Agent, you must obtain a license and install it on the protected computer. If you do not install a license, the product will operate in the Free edition.

You can use the Veeam Agent control panel or Veeam Agent command line interface to install a license, monitor status of the installed license or remove the license if necessary.
Product Editions

Veeam Agent for Linux offers three product editions that define product functionality and operation modes:

- **Server** — a commercial edition that provides access to all product functions and is intended for performing data protection tasks on servers that run Linux OS. Veeam Agent for Linux can operate in the server edition if a commercial license that supports this edition is installed on the protected computer.

- **Workstation** — a commercial edition that offers limited capabilities that are sufficient for performing data protection tasks on desktop computers and laptops that run Linux OS. Veeam Agent for Linux can operate in the workstation edition if a commercial license that supports this edition is installed on the protected computer.

- **Free** — a free edition that offers the same capabilities as the Workstation edition but does not come with a commercial support program. In contrast to the workstation and server editions, the Free edition does not require a license.

For more information about product editions, pricing and features available for them, see [this Veeam webpage](#).

**TIP:**

To check in which edition Veeam Agent for Linux currently operates, you can use the Veeam Agent for Linux control panel or command line interface. To learn more, see [Viewing License Information](#).

When you install a license on the protected computer, you can select in which edition Veeam Agent for Linux will operate: server edition or workstation edition (if both editions are supported by the license). If you use Veeam Agent for Linux with Veeam Backup & Replication, you must manage product licenses and editions from the Veeam Backup & Replication console. To learn more, see [Managing License with Veeam Backup & Replication](#).

After the license expires, Veeam Agent for Linux automatically switches to the Free edition. To learn more, see [License Expiration](#).

Limitations for Free and Workstation Editions

Compared to the Server edition of Veeam Agent for Linux, Free and Workstation editions have the following limitations:

1. [For Free edition] The number of backup jobs that you can configure in Veeam Agent for Linux is limited to one.
2. [For Free edition] You cannot use a Veeam Cloud Connect repository as a target location for backup files.
3. [For Workstation edition] The number of backup jobs that you can configure in Veeam Agent for Linux is limited to one backup job targeted at a local drive, network shared folder or Veeam backup repository plus unlimited number of backup jobs targeted at a Veeam Cloud Connect repository.
4. You cannot specify pre-freeze and post-thaw scripts in the backup job settings.
5. You cannot specify database system processing settings.
License Agreement

After you install Veeam Agent for Linux, you must accept terms of the product license agreement and license agreements for third-party components operating as part of the product. Until you accept the license agreements, you will not be able to perform backup and data recovery tasks with the Veeam Agent for Linux control panel and command line interface.

License agreements are located in the `/usr/share/doc/veeam` directory of the machine where you installed the product.

The process of accepting license agreements differs depending on the way you work with Veeam Agent for Linux — using the control panel or command line interface.

- When you launch the Veeam Agent for Linux control panel for the first time, Veeam Agent prompts you to accept the license agreements at the **Agreements** step of the initial setup wizard. To learn more, see Accept License Agreements.

- When you run a Veeam Agent for Linux command, for example, `veeamconfig repository create`, Veeam Agent prompts you to accept license agreements. To accept the license agreement, type `y` or `yes` in the command prompt and press Enter.

   Alternatively, you can accept license agreements using the dedicated commands. To learn more, see Accepting License Agreements.
Installing License

When you launch the Veeam Agent for Linux control panel for the first time, Veeam Agent for Linux offers you to install a license at the License step of the initial setup wizard. You can choose to install the license immediately or postpone this operation.

If you choose to postpone the license installation process, you can install a license later at any time you need. Until you install a license, Veeam Agent for Linux will operate in the Free edition. To learn more, see Product Editions.

**NOTE:**

If you choose not to install a license and use Veeam Agent for Linux in the Free edition, Veeam Agent for Linux will display a notification offering to install a license every time you open the control panel. The notification will appear in the control panel until Veeam Agent for Linux completes the first backup job session.

To install a license:

1. Launch the Veeam Agent for Linux control panel with the `veeam` or `veeamconfig ui` command.
2. In the Veeam Agent for Linux control panel, press the ‘m’ key to open the Miscellaneous menu.
3. In the menu, make sure that the Manage License option is selected and press Enter.
4. In the Manage license window, make sure that the Install button is selected and press Enter.
5. In the Choose license window, in the File location field, specify a path to the license key:
   a. Select the Browse option with the Tab key and press Space or Enter.
   b. In the Choose license file location window, select the necessary directory and press Enter.
   c. Repeat the step ‘b’ until a path to the directory in which the license key resides appears in the Current directory field.
6. In the Choose agent edition to use on this computer section, select the product edition in which Veeam Agent for Linux will operate and press Enter. To learn more about editions, see Product Editions.
7. Veeam Agent for Linux will install the license and display a window notifying that the license is successfully installed. Press Enter to finish the license installation process.

**TIP:**

If you chose to install the license immediately from the Veeam Agent for Linux welcome screen notification, you will pass to the Choose license step right from the notification window.

6. In the Choose agent edition to use on this computer section, select the product edition in which Veeam Agent for Linux will operate and press Enter. To learn more about editions, see Product Editions.
7. Veeam Agent for Linux will install the license and display a window notifying that the license is successfully installed. Press Enter to finish the license installation process.

**TIP:**

After you install a license, you can view information about the license (expiration date, status of the license, current edition of the product and so on) in the Manage license window. You can also check information about the license using the Veeam Agent for Linux command line interface. To learn more, see Viewing License.
Choose License

File location:
/home/user/veeam/license/veeam_agent_linux.ental.5000.lic [Browse]

Choose agent edition to use on this computer:
( ) Workstation
Entitles you for 24x7x365 technical support via phone or email

( ) Server
In addition to 24x7x365 technical support, this edition allows creating multiple jobs, execute pre-freeze and post-thaw snapshot scripts for application-consistent backups

[OK] [Cancel]
Viewing License Information

To view information about the installed license, do the following:

1. Launch the Veeam Agent for Linux control panel with the `veeam` or `veeamconfig ui` command.
2. In the Veeam Agent for Linux control panel, press the 'm' key to open the Miscellaneous menu.
3. In the menu, make sure that the Manage License option is selected and press Enter.

Veeam Agent for Linux will display information about the license.
Removing License

You can remove the license if necessary. To remove a license:

1. Launch the Veeam Agent for Linux control panel with the veeam or veeamconfig ui command.
2. In the Veeam Agent for Linux control panel, press the 'm' key to open the Miscellaneous menu.
3. In the menu, make sure that the Manage License option is selected and press Enter.
4. In the Manage license window, press Tab to select the Remove button, then press Enter.
5. Veeam Agent for Linux will remove the license and display a window notifying that the license is successfully removed. Press Enter to finish the license removal process.

NOTE:
After you remove the license, Veeam Agent for Linux will continue to operate in the Free edition. Consider the following:

- If Veeam Agent for Linux operated in the Server edition and multiple backup jobs were configured, after switching to the Free edition, all backup jobs will fail.
- If pre-freeze and/or post-thaw scripts were specified for a backup job, after switching to the Free edition, this backup job will fail.
- If database system processing was set for a backup job, after switching to the Free edition, this backup job will fail.
License Expiration

30 days before the license expiration date, Veeam Agent for Linux will display a warning at the top of the control panel. After the license expires, Veeam Agent for Linux will switch to the Free edition.

Consider the following:

- If Veeam Agent for Linux operated in the Server edition and multiple backup jobs were configured, after switching to the Free edition, all backup jobs will be failing.
- If pre-freeze and/or post-thaw scripts were specified for a backup job, after switching to the Free edition, this backup job will be failing.
- If database system processing was set for a backup job, after switching to the Free edition, this backup job will be failing.

You can switch to the Free edition manually at any time if necessary. To learn more, see Removing License.
Managing License with Command Line Interface

You can use the Veeam Agent for Linux command line interface to perform the following operations with the license:

- Accept license agreements for the product itself and its third-party components.
- Install a license on the protected computer.
- View information about the license.
- Remove the license.
Accepting License Agreements

To work with Veeam Agent for Linux, you must accept terms of the product license agreement and license agreements for third-party components operating as part of the product. Until you accept license agreements, you can use the `veeamconfig` utility to run the following commands only:

- `veeamconfig agreement show`
- `veeamconfig help` (or `veeamconfig -h` and `veeamconfig --help`)
- `veeamconfig mode info`
- `veeamconfig mode reset`
- `veeamconfig version` (or `veeamconfig -v` and `veeamconfig --version`)
- `veeamconfig ui`

To accept license agreements, use the following command:

```
veeamconfig agreement accepteula && veeamconfig agreement acceptthirdpartylicences
```

**TIP:**
To check whether license agreements are accepted, use the following command: `veeamconfig agreement show`. 
Installing License

To install a license, use the following command:

```
veeamconfig license install --path <path> --workstation
```

or

```
veeamconfig license install --path <path> --server
```

where:

- `<path>` — path to the license key file in the local file system of your computer.
- `workstation` or `server` — edition in which Veeam Agent will operate. To learn more about editions, see `Product Editions`.

Veeam Agent for Linux will install the license and display information about the license. You can also view this information later at any time. To learn more, see `Viewing License Information`.

For example:

```
user@srv01:~$ veeamconfig license install --path /home/user/veeam/license/veeam.lic --server
License was installed successfully.
License information:
License source: Local license
Mode: Server
Support expiration: 2019/09/20 (649 days left)
Status: License is valid.
Issued to: TechCompany
E-mail: administrators@tech.com
```

TIP:
You can also install a license using the Veeam Agent control panel. To learn more, see `Installing License`.
Viewing License Information

You can view information about the installed license. Use the following command:

```
veeamconfig license show
```

Veeam Agent for Linux will display information about the license. For example:

```bash
user@srv01:$ veeamconfig license show
License information:
  License source: Local license
  Mode: Server
  Support expiration: 2019/09/20 (649 days left)
  Status: License is valid.
  Issued to: TechCompany
  E-mail: administrators@tech.com
```
Removing License

You can remove a license with the following command:

```
veeamconfig license remove
```

After you remove the license, Veeam Agent for Linux will continue to operate in the Free edition. Consider the following:

- If Veeam Agent operated in the Server edition and multiple backup jobs were configured, after switching to the Free edition, all backup jobs will be failing.

- If pre-freeze and/or post-thaw scripts were specified for a backup job, after switching to the Free edition, this backup job will be failing.

- If database system processing was set for a backup job, after switching to the Free edition, this backup job will be failing.
Performing Backup

You can back up your data to protect the entire computer image, individual volumes or folders and files on your computer. To back up your data, you must configure a backup job. Depending on the product edition, Veeam Agent lets you configure one or several backup jobs targeted at the same or different backup repositories.

You can configure a backup job that will automatically back up your data by the defined schedule. You can also start a backup job manually at any time.
Creating Custom Veeam Recovery Media

In addition to the generic Veeam Recovery Media that is available for download at the Veeam website, you can create a custom Veeam Recovery Media. This option may be helpful if your computer uses hardware that requires drivers not included in the generic Veeam Recovery Media. When you create a custom Veeam Recovery Media, Veeam Agent copies the Linux kernel running on your computer with its currently loaded modules and includes them into the custom recovery media.

You can create a custom Veeam Recovery Media in one of the following ways:

- With the Veeam Agent control panel. You can perform this operation at the process of initial product setup at the Recovery ISO step of the initial setup wizard.
- With the Veeam Agent command line interface. You can perform this operation at any time you need.

If you create a custom Veeam Recovery Media using the command line interface, you can also specify a directory that contains additional drivers that you want to include in the recovery media. Veeam Agent will copy the content of the specified directory and add it to the root directory of the custom Veeam Recovery Media ISO file.

Before you create custom Veeam Recovery Media, check the following prerequisites:

- The Linux system must have the `genisoimage` package installed. For openSUSE and SLES 15 SP0 - SP1 distributions, the Linux system must have the `mkisofs` package installed.

- If you plan to create custom Veeam Recovery Media with EFI support, the Linux system must also have the following packages installed:
  - xorriso
  - isolinux (or syslinux, if the software package repository of your Linux distribution lacks the `isolinux` package)

To create custom Veeam Recovery Media, use the following command:

```bash
veeamconfig patchiso --input <input_path> --output <output_path> --copy <additional_path>
```

or

```bash
veeamconfig patchiso --efi --input <input_path> --output <output_path> --copy <additional_path>
```

where:

- `<input_path>` — path to the ISO file of the generic Veeam Recovery Media.
- `<output_path>` — path to the resulting ISO file of the custom Veeam Recovery Media.
- `<additional_path>` — path to a directory with additional drivers that you want to include in the Veeam Recovery Media.
- `--efi` — option that defines whether custom Veeam Recovery Media should be able to boot on EFI-based systems. Without this option, custom Veeam Recovery Media will be able to boot on BIOS-based systems only.
For example:

```
$ veeamconfig patchiso --input veeam/iso/veeam-recovery-media.iso --output veeam/iso/veeam-recovery-media-srv01.iso --efi
```
Creating Backup Jobs

You can choose one of the following backup modes:

- Backup of an entire computer image
- Backup of specific computer volumes, for example, a system volume or secondary volume
- Backup of individual files and folders

[For Server Edition] You can configure one or several backup jobs to back up your data. Configuring several backup jobs may be useful in the following situations:

- You can configure separate backup jobs for volume-level backup and file-level backup.
- You can configure backup jobs targeted at different backup repositories to keep several copies of your backed-up data at different locations.
- You can configure several backup jobs and define individual schedule for every job to back up necessary data at the desired time.

With Veeam Agent, you can configure the backup job in one of the following ways:

- With the Backup Job wizard
- With the command line interface
Creating Backup Job with Backup Job Wizard

You can configure volume-level and file-level backup jobs with the Backup Job wizard.

Before You Begin

Before you configure the backup job, check the following prerequisites:

- The target location where you plan to store backup files must have enough free space.
- When you configure the backup job with the Backup Job wizard, Veeam Agent creates the job with default advanced settings: compression level and data block size. To specify these parameters explicitly, you should create a backup job with the command line interface.
- [For Veeam Backup & Replication repository targets] You can store created backups in a backup repository only if the backup server runs Veeam Backup & Replication 11.
- [For Veeam Backup & Replication repository targets] If you plan to use a Veeam Backup & Replication repository as a target for backups, you must pre-configure user access permissions on this backup repository. To learn more, see Setting Up User Permissions on Backup Repositories.

Backup has the following limitations:

- You cannot save the backup of entire computer on the local computer disk. Use an external hard drive or USB drive, network shared folder or backup repository as a target location.
- Veeam Agent does not back up data to which symbolic links are targeted. It only backs up the path information that the symbolic links contain. After restore, identical symbolic links are created in the restore destination.
- Keep in mind that Veeam Agent stops running the backup job after 21 days (504 hours).

Navigating Backup Job Wizard

The Backup Job wizard window comprises the following areas:

- The navigation pane, located on the left of the window, displays the list of wizard steps and currently selected step of the wizard
- The working area displays controls relating to a specific step of the wizard.
- The buttons area, located at the bottom of the window, displays buttons that you can use to switch between steps of the wizard (Previous and Next) and close the wizard (Cancel and Finish).

In the Backup Job wizard, the use of a mouse is not supported. To navigate the Backup Job wizard and associated dialog windows, you can use the following keys:

- **Tab** — to switch between displayed controls in the working area and buttons in the buttons area. The currently selected control or button is highlighted with a green color.
- **Up** and **Down** — to switch between items in a scrollable list.
- **Space** — to select the necessary item in a list. The selected item's mark may vary in different steps of the wizard.
- **Enter** — to proceed to the next step of the wizard or to open a directory.
- **Backspace** — to return to the previous step of a wizard.
- **Escape** — to cancel the backup job configuration and exit the wizard.

**TIP:**
You can switch between steps of the Backup Job wizard in two ways. The easier and more comfortable way is to use the **Enter** key to proceed to the next step and **Backspace** key to return to the previous step of the wizard. You can also use the **Tab** key to select the **Next** or **Previous** button in the buttons area and then press **Enter** to switch to the next or previous step of the wizard respectively.
Step 1. Launch Backup Job Wizard

To launch the **Backup Job** wizard, do the following:

1. Launch the Veeam Agent control panel with the `veeam` or `veeamconfig ui` command:

2. If you have not configured any backup jobs yet, Veeam Agent will display a welcome screen. Press the 'c' key to proceed to the Backup Job wizard and configure the backup job.

3. If you have already configured and performed a backup job, Veeam Agent will display the list of backup job sessions. When you press 'c' to launch the Backup Job wizard, Veeam Agent will display a list of configured backup jobs. To configure a new backup job, select the **Configure new job** option and press Enter.

   **NOTE:**
   
The **Configure new job** option is not available if Veeam Agent for Linux operates in the Free edition and you have already configured one backup job.

To edit settings of a backup job that you have already configured, select the job in the list and press Enter. To learn more, see Editing Backup Job Settings.

If you have decided not to create a backup job, press **Escape** to close the list of backup jobs and return to the welcome screen. After that, you can press **Escape** once again to return to the command line interface.
Step 2. Specify Backup Job Name

At the Name step of the wizard, in the Job name field, type the name for the backup job and press Enter.

TIP:
To proceed to the next step of the wizard, you can also select the Next button with the Tab key and then press Enter.
Step 3. Select Backup Mode

At the Backup mode step of the wizard, select the mode in which you want to create a backup:

1. Select the necessary backup mode. You can select one of the following options:

   o **Entire machine** — select this option if you want to create a backup of the entire computer image. When you restore data from such backup, you will be able to recover the entire computer image as well as data on specific computer volumes: files, folders, application data and so on. With this option selected, you will pass to the Destination step of the wizard.

   o **Volume level backup** — select this option if you want to create a backup of specific computer volumes, for example, the system volume. When you restore data from such backup, you will be able to recover data on these volumes only: files, folders, application data and so on. With this option selected, you will pass to the Volumes step of the wizard.

   o **File level backup** — select this option if you want to create a backup of individual directories on your computer. With this option selected, you will pass to the Files step of the wizard.

2. [For file-level backup] If you want to perform backup in the snapshot-less mode, select Disable snapshot. With this option selected, Veeam Agent will not create a snapshot of the backed-up volumes during backup. This allows Veeam Agent to back up data residing in file systems that are not supported for snapshot-based backup with Veeam Agent. To learn more, see Snapshot-Less File-Level Backup.

**IMPORTANT!**

Consider the following:

- [For entire machine backup] Certain limitations for EMC PowerPath configuration apply. To learn more, see this Veeam KB article.

- [For volume-level backup] Volume-level backup job relies on a device name in the /dev directory. Device names in the /dev directory (e.g. /dev/md-127, /dev/dm-1) must stay persistent for backed-up volumes. Otherwise, the job will back up the wrong volume.

- [For file-level backup] If the backed-up file system has a complex folder structure with many hierarchy levels, during incremental backup, the inbound network traffic on the Veeam Agent computer may exceed by far the outbound traffic. Significant amount of data can be transferred to the Veeam Agent computer from the target backup location even if few files are changed since the previous job session.

**TIP:**

File-level backup is typically slower than volume-level backup. If you plan to back up all folders with files on a specific volume, it is recommended that you configure volume-level backup instead of file-level backup.
Choose what data you want to back up from this computer

<table>
<thead>
<tr>
<th>Name</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Backup mode</td>
<td></td>
</tr>
<tr>
<td>Destination</td>
<td></td>
</tr>
<tr>
<td>Location</td>
<td></td>
</tr>
<tr>
<td>Advanced</td>
<td></td>
</tr>
<tr>
<td>Schedule</td>
<td></td>
</tr>
<tr>
<td>Summary</td>
<td></td>
</tr>
</tbody>
</table>

- **( ) Entire machine (recommended)**
  Back up the entire host for fast recovery on any level.

- **( ) Volume level backup**
  Back up images of selected partitions and volumes.

- **(x) File level backup**
  Back up individual files and folders.

- **(x) Disable snapshot**
  Crash-consistent file-level backup without snapshot.
Step 4. Specify Backup Scope Settings

Specify backup scope for the backup job:

- Select volumes to back up — if you have selected the **Volume level backup** option at the **Backup Mode** step of the wizard.
- Select folders to back up — if you have selected the **File level backup** option at the **Backup Mode** step of the wizard.

Selecting Volumes to Back Up

The **Volumes** step of the wizard is available if you have chosen to create a volume-level backup.

At this step of the wizard, you must specify the backup scope — define what volumes you want to include in the backup. Veeam Agent lets you include the following types of objects in the volume-level backup:

- Block devices (entire disks and individual volumes)
- Mount points
- LVM logical volumes and volume groups
- Btrfs storage pools and subvolumes

Selecting Devices

To add a block device to the backup scope, do the following:

1. At the **Volume** step of the wizard, make sure that the **Device** option is selected and press **Enter**.
2. In the **Add devices to scope** window, select individual volumes or entire computer disks that you want to include in the backup and press **Enter**.
   - To include individual volumes of your computer in the backup, select block devices that represent volumes that you want to back up, for example: *sda1* and/or *sda6*.
   - To include all volumes on a computer disk in the backup, select block devices that represent disks whose volumes you want to back up, for example: *sda* and/or *sdb*. All volumes on the selected disk will be automatically selected, too.

   To navigate the list of volumes and select the necessary items, use **Up**, **Down** and **Space** keys. To learn more, see [Navigating Backup Job Wizard](#).

If you have created several system partitions, for example, a separate partition for the `/boot` directory, you should remember to include all of these partitions in the backup. Otherwise, Veeam Agent does not guarantee that the OS will boot properly when you attempt to recover from such backup.
NOTE:

If you include a block device in the backup, and this block device is a physical volume assigned to an LVM volume group, Veeam Agent will include the whole LVM volume group in the backup.

Selecting Mount Points

To add a mount point to the backup scope, do the following:

1. At the Volume step of the wizard, select the Mountpoint option and press Enter.
2. In the **Add mountpoints to scope** window, select mount points that you want to include in the backup and press **Enter**.

To navigate the list of mount points and select the necessary mount points, use **Up, Down** and **Space** keys. To learn more, see **Navigating Backup Job Wizard**.

Selecting LVM Volumes

To add an LVM logical volume or volume group to the backup scope, do the following:

1. At the **Volume** step of the wizard, select the **LVM** option and press **Enter**.

2. In the **Add LVM to scope** window, select LVM logical volumes or volume groups that you want to include in the backup and press **Enter**.

   To navigate the list of LVM volumes and select the necessary items, use **Up, Down** and **Space** keys. To learn more, see **Navigating Backup Job Wizard**.

   If you include an LVM volume group in the backup, all LVM logical volumes in the selected volume group will be automatically selected, too.

**NOTE:**

Veeam Agent does not back up LVM snapshots.
Selecting Btrfs Volumes

To add a Btrfs storage pool or subvolume to the backup scope, do the following:

1. At the Volume step of the wizard, select the BTRFS option and press Enter.
2. In the Add BTRFS to scope window, select Btrfs storage pools or subvolumes that you want to include in the backup and press Enter.

   To navigate the list of Btrfs pools and subvolumes and select the necessary items, use Up, Down and Space keys. To learn more, see Navigating Backup Job Wizard.

   Veeam Agent identifies Btrfs storage pools by UUIDs. If you include a Btrfs pool in the backup, all Btrfs subvolumes in the selected pool will be automatically selected, too.

**NOTE:**

You cannot add read-only Btrfs snapshots to the backup scope.
Selecting Files and Directories to Back Up

The Files step of the wizard is available if you have chosen to create a file-level backup.

At this step of the wizard, you must specify the backup scope — define what directories with files you want to include in the backup.

In the file-level backup mode, you must include in the backup at least one directory. If you do not want to back up some subdirectories of the specified directory, you can exclude these directories from the backup.

You can also include or exclude files of a specific type in/from the backup. You can specify file names explicitly or use UNIX wildcard characters to define file name masks. Veeam Agent will apply the specified file name masks to files in directories that are included in the backup.

To specify the backup scope:

1. At the Files step of the wizard, make sure that the Add directories option is selected and press Enter.

2. In the Choose directories window, select one or several directories that you want to include in the file-level backup.
   - To navigate the list of directories, use the Up and Down keys.
   - To browse for subdirectories, navigate to the necessary directory and press Enter.
   - To include a directory in the backup, navigate to the necessary directory and press Space. The included directory will be marked with the '+' character. All subdirectories of the selected directory will be included in the backup too.
3. Specify directories that you want to exclude from the file-level backup. To exclude a directory:
   
a. Browse for subdirectories of a directory that you have included in the backup.
b. Navigate to the directory that you want to exclude from the backup and press **Space**. The excluded directory will not be marked with the ‘+’ character.

4. Switch to the **OK** button and press **Enter**. Veeam Agent will display a list of paths to the selected directories and the number of excluded subdirectories for each directory in the list.

5. Specify file name masks for files that you want to include or exclude in/from the backup:
   a. Select the **File Masks** option with the **Tab** key and press **Enter**.
   b. In the **File masks** window, make sure that the **Create Mask** button is selected and press **Enter**.
   c. In the **Mask** field, enter the file name mask, for example, `report.pdf`, `*filename*` or `*.odt`. Keep in mind that you must specify all names with masks in double quotation marks ("").
   d. In the **Type** field, select one of the following options:
      - **Exclude** — if you do not want to back up files whose names match the specified mask. Veeam Agent will back up all files in the directories selected for backup except for such files.
      - **Include** — if you want to back up files whose names match the specified mask. Veeam Agent will create a backup only for such files in the directories selected for backup.

You can use a combination of include and exclude masks. Keep in mind that exclude masks have a higher priority than include masks. For example, you can specify masks in the following way:

- **Include mask**: `report*.*`
• Exclude mask: *.odt

Veeam Agent will include in the backup all files whose name begins with report except for the files of the ODT format.

e. Press Enter. Veeam Agent will display in the File masks window the specified file mask and its type: Include or Exclude.

f. Repeat steps 'b'–'e' for each mask that you want to specify.

g. After you specify all file masks, switch to the OK button and press Enter.
**TIP:**

To remove a file name mask, in the File masks window, select the necessary mask and press Delete.
Step 5. Select Backup Destination

At the **Destination** step of the wizard, select a target location for the created backup.

You can select one of the following options:

- **Local** — select this option if you want to save the backup on a removable storage device attached to the computer or on a local computer drive. With this option selected, you will pass to the **Location** step of the wizard.

- **Shared Folder** — select this option if you want to save the backup in a network shared folder. With this option selected, you will pass to the **Network** step of the wizard.

- **Veeam Backup & Replication** — select this option if you want to save the backup on a backup repository managed by the Veeam backup server. With this option selected, you will pass to the **Veeam** step of the wizard.

- **Veeam Cloud Connect repository** — select this option if you want to create the backup on a cloud repository exposed to you by the Veeam Cloud Connect service provider. With this option selected, you will pass to the **Service Provider** step of the wizard.

It is recommended that you store backups in the external location like USB storage device or network shared folder. You can also keep your backup files on the separate non-system local drive.
Step 6. Specify Backup Storage Settings

Specify backup storage settings for the backup job:

- **Local storage settings** — if you have selected the Local storage option at the Destination step of the wizard.
- **Shared folder settings** — if you have selected the Shared folder option at the Destination step of the wizard.
- **Veeam backup repository settings** — if you have selected the Veeam backup repository option at the Destination step of the wizard.
- **Veeam Cloud Connect repository settings** — if you have selected the Veeam Cloud Connect repository option at the Destination step of the wizard.

**NOTE:**

The Veeam Cloud Connect repository option is available if Veeam Agent operates in the Workstation or Server edition.

Local Storage Settings

The Location step of the wizard is available if you have selected the Local option at the Destination step of the wizard. Specify location for the backup file and retention policy for the backup job:

1. To specify location for the backup file, browse to the directory where backup files must be saved:
   a. Select the Browse option with the Tab key and press Space or Enter.
   b. In the Choose backup location window, select the necessary directory and press Enter.
   c. Repeat the step 'b' until a path to the directory in which you want to save backup files appears in the Current directory field.
   d. To create a new directory, switch to the Create Dir button, press Enter, then type a name for the new directory and press Enter.
   e. Switch to the OK button and press Enter. Veeam Agent will display the path to the specified directory in the Location field.

   Alternatively, you can type a path to the directory in which you want to save backup files in the Location field.

   After you specify location for the backup, Veeam Agent will display the following information on the volume where the directory selected for backup storage resides:
   - **Space** — total size of the volume on which the selected directory resides.
   - **Free** — free space on the volume where the selected directory resides.
   - **Type** — file system type of the volume on which the selected directory resides.

2. In the Restore points field, specify the number of backup files that you want to keep in the target location. By default, Veeam Agent keeps 7 latest backup files. When the number of restore points is exceeded, Veeam Agent for Linux will remove the earliest restore point from the backup chain.
IMPORTANT!

Consider the following:

- The backup location must reside on a separate volume from a volume whose data you plan to back up.
- USB storage devices formatted as FAT32 do not allow storing files larger than 4 GB in size. For this reason, it is recommended that you do not use such USB storage devices as a backup target.

Shared Folder Settings

The **Network** step of the wizard is available if you have selected the **Shared Folder** option at the **Destination** step of the wizard.

To save backup files in a remote network location, Veeam Agent mounts to the local file system of your computer the network shared folder that you specify as a location for the backup. When you specify the network shared folder settings, Veeam Agent saves information about the network shared folder and its mount point in the database.

You do not need to mount the network shared folder in advance before every backup job run. Veeam Agent will do it automatically when the backup job is started manually or upon schedule.

After the backup job completes, Veeam Agent will automatically unmount the network shared folder.

Specify shared folder settings:

1. Select the type of a network shared folder:
   - **NFS** — to connect to a network shared folder using the NFS protocol.
   - **SMB** — to connect to a network shared folder using the SMB (CIFS) protocol.
2. In the **Path** field, specify the network shared folder name in the **SERVER/DIRECTORY** format: type an IP address or domain name of the server and the name of the network shared folder in which you want to store backup files.

Every time the backup job starts, Veeam Agent will automatically mount the specified network shared folder to the `/tmp/veeam` directory in the computer file system. After the backup job completes, Veeam Agent will unmount the network shared folder.

3. [For SMB network shared folder] In the **Domain** field, type a name of the domain in which the account that has access permissions on the shared folder is registered, for example: **DOMAIN**.

4. [For SMB network shared folder] In the **Username** field, type a name of the account that has access permissions on the shared folder.

5. [For SMB network shared folder] In the **Password** field, type a password of the account that has access permissions on the shared folder.

6. In the **Restore points** field, specify the number of backup files that you want to keep in the target location. By default, Veeam Agent keeps 7 latest backup files. When the number of restore points is exceeded, Veeam Agent will remove the earliest restore point from the backup chain.

---

### Veeam Backup Repository Settings

If you have selected to store backup files on a Veeam Backup & Replication repository, specify settings to connect to the backup repository:

1. **Specify backup server settings.**
2. **Select the Veeam backup repository.**
Specifying Backup Server Settings

The Veeam step of the wizard is available if you have chosen to store backup files on a Veeam Backup & Replication repository.

Specify settings for the Veeam backup server that manages the target backup repository:

1. In the Address field, specify a DNS name or IP address of the Veeam backup server.
2. In the Port field, specify a number of the port over which Veeam Agent must communicate with the backup repository. By default, Veeam Agent uses port 10006.
3. In the Login field, type a name of the account that has access to the Veeam backup repository.
4. In the Domain field, type a name of the domain in which the account that has access to the Veeam backup repository is registered, for example: DOMAIN.
5. In the Password field, type a password of the account that has access to the Veeam backup repository.

Permissions on the backup repository managed by the target Veeam backup server must be granted beforehand. To learn more, see Setting Up User Permissions on Backup Repositories.

**IMPORTANT!**

If you specify a DNS name of the Veeam backup server, make sure that the Veeam backup server name is resolved into IPv4 address on the machine where Veeam Agent is installed. The Veeam Backup Service in Veeam Backup & Replication listens on IPv4 addresses only. If the Veeam backup server name is resolved into IPv6 address, Veeam Agent will fail to connect to the Veeam backup server.
Selecting Backup Repository

The Repository step of the wizard is available if you have chosen to save backup files on a Veeam Backup & Replication repository.

Specify settings for the target backup repository:

1. From the list of available backup repositories, select a backup repository where you want to store backups. The list of backup repositories displays only those repositories on which you have permissions to store data. To learn more, see Setting Up User Permissions on Backup Repositories.

2. In the Restore points field, specify the number of restore points that you want to store in the target location. By default, Veeam Agent keeps 7 latest restore points. After this number is exceeded, Veeam Agent will remove the earliest restore points from the backup chain.
   
   To learn more, see Backup Retention Policy.

Veeam Cloud Connect Repository Settings

If you have selected to store backup files on a Veeam Cloud Connect repository, specify settings to connect to the cloud repository:

1. Specify service provider settings.
2. Verify the TLS certificate and specify user account settings.
3. Select the cloud repository.
NOTE:
The Veeam Cloud Connect repository option is available if Veeam Agent operates in the Workstation or Server edition.

Specifying Service Provider Settings

The Provider step of the wizard is available if you have chosen to save backup files on a Veeam Cloud Connect repository.

Specify settings for the cloud gateway that the Veeam Cloud Connect service provider (SP) or your backup administrator has provided to you:

1. In the Address field, enter a full DNS name or IP address of the cloud gateway.
2. In the Port field, specify the port over which Veeam Agent will communicate with the cloud gateway. By default, port 6180 is used.

Specifying User Account Settings

The Credentials step of the wizard is available if you have chosen to save backup files on a cloud repository and specified settings for the cloud gateway.
Verify TLS certificate settings and specify settings for the tenant account or subtenant account that you want to use to connect to the cloud repository.

1. In the Certificate details window, review information about the TLS certificate obtained from the SP side and verify the TLS certificate:
   - [Optional] To verify the TLS certificate with a thumbprint, do the following:
     i. Select the Verify thumbprint button with the Tab key and press Enter.
     ii. Copy the thumbprint you obtained from the SP to the Clipboard and enter it to the Thumbprint verification field.
     iii. Switch to the Verify button and press Enter. Veeam Agent will check if the thumbprint you entered matches the thumbprint of the obtained TLS certificate.
     TLS certificate verification is optional. You can use this option to verify self-signed TLS certificates. TLS certificates signed by the CA do not require additional verification.
   - To accept the TLS certificate, select the Accept button with the Tab key and press Enter.

2. In the Username field, enter the name of the tenant or subtenant account that the SP or your backup administrator has provided to you. The name of the subtenant account must be specified in the TENANT\SUBTENANT format.

3. In the Password field, provide a password for the tenant or subtenant account.

Selecting Cloud Repository

The Repository step of the wizard is available if you have chosen to save backup files on a cloud repository and specified settings to connect to the SP.
Specify settings for the cloud repository:

1. From the **Repository** list, select a cloud repository where you want to store created backups. The **Repository** list displays only those cloud repositories that can be accessed by the tenant or subtenant account that you use to connect to the service provider.

2. In the **Restore points** field, specify the number of restore points that you want to store in the target location. By default, Veeam Agent keeps 7 latest restore points. After this number is exceeded, Veeam Agent will remove the earliest restore points from the backup chain.

   To learn more, see **Backup Retention Policy**.
Step 7. Specify Advanced Backup Settings

At the **Advanced** step of the wizard, specify advanced settings for the backup job:

- Data encryption settings
- File indexing settings
- Oracle database system processing settings
- MySQL database system processing settings
- PostgreSQL database system processing settings
- Active full backup settings
- Backup maintenance settings
- Script settings
NOTE:
Consider the following:

- You cannot specify encryption settings for the backup job if you have chosen to save backup files on a Veeam backup repository. Encryption options for Veeam Agent backup jobs targeted at the backup repository are managed by a backup administrator working with Veeam Backup & Replication. To learn more about data encryption capabilities available in Veeam Backup & Replication, see the Data Encryption section in the Veeam Backup & Replication User Guide.

- You can specify file indexing settings only if Veeam Agent operates in the Workstation or Server edition.

- You can specify settings for Oracle, MySQL or PostgreSQL database system processing only if Veeam Agent operates in the Server edition. The settings are available for a volume-level backup job only.

- You can specify backup maintenance settings only if you have selected the Veeam backup repository or Veeam Cloud Connect repository option at the Destination step of the wizard.

- You cannot specify data compression settings when you configure a backup job with the Backup Job wizard. If you want to specify these settings, consider creating the backup job with the Veeam Agent command line interface. To learn more, see Advanced Backup Job Settings.

Data Encryption Settings

If you want to encrypt the content of backup files, at the Advanced step of the wizard, specify data encryption settings for the backup job:

1. Select the Backup encryption option with the Tab key and press Enter.
**NOTE:**

The **Backup encryption** option is unavailable if you have chosen to save backup files on a Veeam backup repository. Encryption options for Veeam Agent backup jobs targeted at the backup repository are managed by a backup administrator working with Veeam Backup & Replication. To learn more about data encryption capabilities available in Veeam Backup & Replication, see the **Data Encryption** section in the Veeam Backup & Replication User Guide.

2. In the **Encryption** window, make sure that the **Enable backup file encryption** option is selected and press **Space**.

3. In the **Password** field, type a password that you want to use for encryption.

4. In the **Hint** field, type a hint for the password. In case you lose the password, the specified hint will help you to remember the lost password.

5. Switch to the **Ok** button and press **Enter**.

---

**File Indexing Settings**

At the **Advanced** step of the wizard, specify file indexing settings for the backup job:

1. Select the **File system indexing** option with the **Tab** and **Down** keys and press **Enter**.
NOTE:
The File system indexing option is available if Veeam Agent for Linux operates in the Workstation or Server edition.

2. In the Indexing window, specify the indexing scope:
   
   o Select Index everything if you want to index all files within the backup scope that you have specified at the Backup mode step of the wizard. Veeam Agent for Linux will index all files that reside:
     ▪ On your computer OS (for entire machine backup)
     ▪ On the volumes that you have selected for backup (for volume-level backup)
     ▪ In the directories that you have selected for backup (for file-level backup)
   
   o [For entire machine and volume-level backups] Select Index everything except if you want to index all files within the specified backup scope except those files that reside in specific directories. Enter paths to directories whose files you do not want to index. To separate several paths, use the ',' (comma) character.

   o [For entire machine and volume-level backups] Select Index only following directories to define directories that you want to index. Enter paths to the necessary directories. To separate several paths, use the ',' (comma) character.

3. Switch to the Ok button and press Enter.
Oracle Database Processing Settings

At the Advanced step of the wizard, specify processing settings for the Oracle database system:

1. Select the Oracle processing option with the Tab and Down keys and press Enter.

2. In the Oracle processing section, select one of the following options:
   - **Require successful processing.** With this option selected, Veeam Agent will stop the backup process if an error occurs while processing the Oracle database system.
   - **Try application processing, ignore failures.** With this option selected, Veeam Agent will continue the backup process even if errors occur when processing the Oracle database system.

3. In the Archived logs processing section, specify how Veeam Agent will process archived logs on the Oracle database:
   - **Select Do not delete archived logs** if you want Veeam Agent to keep archived logs. When the backup job completes, Veeam Agent will not delete archived logs.
     It is recommended that you select this option when you do not have databases running in the ARCHIVELOG mode. If the database is running in the ARCHIVELOG mode, archived logs may grow large and consume all disk space. In this case, the database administrator must take care of archived logs themselves.
   - **Select Delete logs older than <N> hours or Delete oldest logs exceeding <N> GB** if you want Veeam Agent to delete archived logs that are older than <N> hours or larger than <N> GB. Veeam Agent will wait for the backup job to complete successfully and then trigger archived logs truncation via Oracle Call Interface (OCI). If the backup job fails, the logs will remain untouched until the next successful backup job session.

4. In the Specify Oracle account with SYSDBA privileges section, specify which account type Veeam Agent will use to connect to the database system.
   - **Select System account** if you want Veeam Agent to use an account of the Veeam Agent machine OS. The account must be a member of the group that owns Oracle database files.
o Select **Oracle account** if you want Veeam Agent to use an Oracle account. The account must have SYSDBA rights.

MySQL Database Processing Settings

**IMPORTANT!**

To process the MySQL database system, the MySQL account must have the following privileges:

- **SELECT** for all tables. If the MySQL account does not have the SELECT privilege for the table, Veeam Agent cannot access table metadata. As a result, Veeam Agent does not process the table. To learn more, see MySQL documentation.

- **LOCK TABLES**. If the MySQL account does not have the LOCK TABLES privilege, Veeam Agent does not process tables based on the MyISAM storage engine.

To obtain information about privileges that are assigned to the account, use MySQL functionality, for example, the SHOW GRANTS statement. To learn more, see MySQL documentation.

At the **Advanced** step of the wizard, specify processing settings for the MySQL database system:

1. Select the **MySQL processing** option with the **Tab** and **Down** keys and press **Enter**.

2. In the **MySQL processing** section, select one of the following options:

   - **Require successful processing**. With this option selected, Veeam Agent will stop the backup process if an error occurs when processing the MySQL database system.

   - **Try application processing, ignore failures**. With this option selected, Veeam Agent will continue the backup process even if errors occur when processing the MySQL database system.
3. In the **Authentication method** section, specify how Veeam Agent will connect to the MySQL database:

   - Select **Password** if you want Veeam Agent to connect with the MySQL account name and password. With this option selected, you must specify account name and password in the backup job settings.
Select **Password file** if you want Veeam Agent to connect with the MySQL account name and password that are stored in the `.my.cnf` password file. With this option selected, you must specify a path to the password file, but do not need to specify account credentials in the backup job settings. To learn more about password file configuration, see Preparing Password File for MySQL Processing.

**NOTE:**
Consider the following:

- If you specify a custom path to the password file, specify a full path. Specifying relative paths is not supported.
- The password file can also contain user-specific connection settings that Veeam Agent will apply to connect to the MySQL database system. For example, if you want to connect to the MySQL database system using the custom socket, specify the socket path in the password file. To learn more, see MySQL documentation.

If you want to use a password file for authentication, create a file. By default, Veeam Agent expects the password file to have the `.my.cnf` name and to be in the home directory of the root user. If the password file has a custom name or is stored in another directory, you can specify a custom path.

Preparing Password File for MySQL Processing

You can use MySQL account credentials that are stored in the password file to connect Veeam Agent for Linux to the MySQL database system.
The password file must have the following contents:

```plaintext
[client]
user=<username>
password=<password>
```

where:

- `<username>` — name of the account that Veeam Agent will use to connect to the MySQL database system.
- `<password>` — password of the account that Veeam Agent will use to connect to the MySQL database system.

For example:

```plaintext
[client]
user=root
password=P@ssw0rd
```

**PostgreSQL Database Processing Settings**

At the **Advanced** step of the wizard, specify processing settings for the PostgreSQL database system:

1. Select the **PostgreSQL processing** option with the **Tab** and **Down** keys and press **Enter**.
2. In the **PostgreSQL processing** section, select one of the following options:
   - **Require successful processing**. With this option selected, Veeam Agent will stop the backup process if an error occurs when processing the PostgreSQL database system.
   - **Try application processing, ignore failures**. With this option selected, Veeam Agent will continue the backup process even if errors occur when processing the PostgreSQL database system.
3. In the **Authentication method** section, specify how Veeam Agent for Linux will connect to the PostgreSQL database:
   - Select **Database user with password** if you want Veeam Agent to connect with the PostgreSQL account name and password. With this method selected, you must specify account name and password in the backup job settings.
   - Select **Database user with password file** if you want Veeam Agent to connect with the PostgreSQL account password that is stored in the `.pgpass` password file. With this method selected, you must specify account name only in the backup job settings. To learn more about password file configuration, see **Password File for PostgreSQL**.
   - Select **System user without password** if you want Veeam Agent to connect using a peer authentication method. In the peer authentication method, Veeam Agent uses the OS account as the PostgreSQL database user name. With this option selected, you must specify OS account in the backup job settings. To learn more about peer authentication, see **PostgreSQL documentation**.
Preparing Password File for PostgreSQL Processing

You can use PostgreSQL account credentials that are stored in the password file to connect Veeam Agent to the PostgreSQL database system.

If you want to use a password file for authentication, create the `.pgpass` file in the home directory of the root user.

The password file must have the following contents:

```
<hostname>:<port>:<database>:<username>:<password>
```

where:

- `<hostname>` — name of the host where the PostgreSQL database system is located.
- `<port>` — number of the free port that Veeam Agent will use to connect to the PostgreSQL database system.
- `<database>` — name of the PostgreSQL database.
- `<username>` — name of the account that Veeam Agent will use to connect to the PostgreSQL database system.
- `<password>` — password of the account that Veeam Agent will use to connect to the PostgreSQL database system.
For example:

```
srv01:5432:mydb:postgres:P@ssw0rd
```

For more information about the password file, see PostgreSQL documentation.

The PostgreSQL database system can use connection settings from one of the following files:

- `postgresql.conf`
- `.pgpass`

By default, Veeam Agent applies connection settings from the `postgresql.conf` file. If you specify host name and port number in the `.pgpass` file, Veeam Agent will use host name and port number from the `.pgpass` file instead of the `postgresql.conf` file to connect to the PostgreSQL database system. If you replace the value in the `.pgpass` file with the asterisk (*) sign, Veeam Agent uses the value from the `postgresql.conf` file.

For example:

```
*:*:mydb:postgres:P@ssw0rd
```

## Active Full Backup Settings

At the **Advanced** step of the wizard, specify active full backup settings for the backup job:

1. Select the **Active full** option with the **Tab** and **Down** keys and press **Enter**.
2. In the **Active full** window, make sure that the **Create active full backups periodically** option is selected and press **Space**.
3. Specify schedule for periodic active full backups:
   - If you want active full backups to run monthly, select the **Monthly on this day** option and specify the day of a month when Veeam Agent will perform active full backup.
   - If you want active full backups to run weekly, do the following:
     - Select the **Weekly on selected days** option, then select **Days** with the **Tab** key and press **Enter**.
     - In the **Days** window, specify days on which Veeam Agent will perform active full backup. By default, Veeam Agent performs active full backup every Saturday. To select days, use **Up**, **Down**, **Right**, **Left** and **Space** keys.
iii. Switch to the **Ok** button with the **Tab** key and press **Enter**.

**Maintenance Settings**

At the **Advanced** step of the wizard, specify backup maintenance settings for the backup job:

1. Select the **Maintenance** option with the **Tab** and **Down** keys and press **Enter**.

   **NOTE:**
   
The **Maintenance** option is available if you have selected the Veeam backup repository or Veeam Cloud Connect repository option at the Destination step of the wizard.

2. In the **Maintenance** window, make sure that the **Allow backup server to prune old backups** option is selected and press **Space**.
3. In the **If this agent has been unavailable <N> days** field, specify the number of days for which you want to keep the backup created with the backup job in the target location. If Veeam Agent for Linux does not create new restore points for the backup, the backup will remain in the target location for the period that you have specified. When this period is over, the backup will be removed from the target location.

By default, the retention period for old backups is 30 days. Do not set this retention period to 1 day or a similar short interval. In the opposite case, the backup job may work not as expected and remove data that you still require.

### Script Settings

At the **Advanced** step of the wizard, specify script settings for the backup job:

1. Select the **Scripts** option with the **Tab** and **Down** keys and press **Enter**.

2. In the **Scripts** window, in the **Job scripts** section, specify custom scripts that you want to execute before and/or after the backup job:
   - In the **Pre-job** field, specify a path to the script that should be executed before the backup job starts.
   - In the **Post-job** field, specify a path to the script that should be executed after the backup job completes.

3. In the **Scripts** window, in the **Snapshot scripts** section, specify custom scripts that you want to execute before Veeam Agent creates a snapshot of the backed-up volume and/or after the snapshot is created:
   - In the **Pre-freeze** field, specify a path to the script that should be executed before Veeam Agent creates a volume snapshot.
In the **Post-thaw** field, specify a path to the script that should be executed after Veeam Agent creates a volume snapshot.

4. Switch to the **Ok** button and press **Enter**.

### IMPORTANT!
You can specify snapshot script settings only if Veeam Agent for Linux operates in the Server edition. To learn more about editions, see [Product Editions](#).

#### Specifying Path to Script

You can specify a path to the executable file of the job or snapshot script in one of the following ways:

1. Type a path to the executable file.
2. Browse to the executable file:
   a. Select the **Browse** option with the **Tab** key and press **Enter**.
   b. In the **Choose script location** window, select the directory being a part of the path to the script and press **Enter**.
   c. Repeat the step 'b' until a path to the directory in which the executable file resides appears in the **Current directory** field.
   d. Select the necessary executable file and press **Enter**.

Alternatively, you can switch to the **Ok** button and press **Enter**.
TIP:
If you do not want to execute a script, you can leave the corresponding field blank and proceed to the next step of the wizard.
Step 8. Specify Backup Schedule

At the **Schedule** step of the wizard, specify the schedule according to which you want to perform backup.

1. Make sure that the **Run the job automatically** check box is selected.
   
   If you want to configure the backup job without schedule, you can clear the **Run the job automatically** check box. In this case you will be able start the configured backup job manually at any time you need.

2. In the **Daily at** field, specify the time of day when the backup job must start.

3. In the list of days of the week, specify days on which the job must start. By default, Veeam Agent will start the backup job daily at the specified time. To exclude specific days from the schedule, clear check boxes next to the necessary days.

Veeam Agent for Linux will save the scheduling settings for the backup job in its database and in the **crontab** configuration file of the root account. Thus, Veeam Agent can start a backup job automatically regardless of the currently running user session. You can change schedule settings at any time in Veeam Agent or edit the **crontab** file manually to fine-tune the schedule. To learn more, refer to the Cron job scheduler documentation.
Step 9. Review Backup Job Settings

At the **Summary** step of the wizard, complete the backup job configuration process.

1. Review settings of the configured backup job.

2. To start the job after you close the wizard, make sure that the **Start job now** check box is selected.

   If you want to start the backup job later, you can clear the **Start job now** check box. You will be able to start the backup job manually at any time you need. To learn more, see **Starting Backup Job**.

3. Press **Enter to exit the wizard**.

<table>
<thead>
<tr>
<th>Name</th>
<th>Job name: DailyBackup</th>
</tr>
</thead>
<tbody>
<tr>
<td>Backup mode</td>
<td></td>
</tr>
<tr>
<td>Volumes</td>
<td></td>
</tr>
<tr>
<td>Destination</td>
<td>Destination: Default Backup Repository</td>
</tr>
<tr>
<td>Veeam Repository</td>
<td>Backup: volumes: sda1,vg,BTRFS: ...26778,MountPoints: ...</td>
</tr>
<tr>
<td>Advanced Schedule</td>
<td>To start the job out of schedule execute:</td>
</tr>
<tr>
<td>&gt; Summary</td>
<td>veeamconfig job start --name &quot;DailyBackup&quot;</td>
</tr>
<tr>
<td></td>
<td>[X] Start job now</td>
</tr>
</tbody>
</table>

What You Do Next

After you configure the backup job, you can start the backup job at any time you need. To learn more, see **Starting Backup Job**.

If some of your data gets lost or corrupted, you can do the following:

- **Recover all computer volumes or specific volumes from the backup.**

- **Recover individual files and folders from the backup.**
Creating Backup Job with Command Line Interface

You can configure the backup job with the command line interface. Using Veeam Agent for Linux commands, you can create volume-level and file-level backup jobs, specify advanced settings for the created backup job, define backup schedule and enable backup encryption.

Creating Volume-Level Backup Job

**IMPORTANT!**

Volume-level backup job relies on a device name in the `/dev` directory. Device names in the `/dev` directory (for example, `/dev/md-127`, `/dev/dm-1`) must stay persistent for backed-up volumes. Otherwise, the job will back up the wrong volume.

You can create a volume-level backup of the entire computer image or specific volumes.

To back up the entire computer image, use the following command:

```
veeamconfig job create volumelevel --name <job_name> --reponame <repository_name> --backupallsystem <advanced_options> <schedule_options> <active_full_backup_options> <indexing_options>
```

To back up specific volumes, use the following command:

```
veeamconfig job create volumelevel --name <job_name> --reponame <repository_name> --objects <volume_to_backup> <advanced_options> <schedule_options> <active_full_backup_options> <indexing_options>
```

where:

- `<job_name>` — name for the created backup job.
- `<repository_name>` — name of the backup repository that should be used as a target location for the backup job. The backup repository must be created in advance. To learn more, see Creating Backup Repository.

If you want to create Veeam Agent backups in a Veeam backup repository of cloud repository, you need connect to the Veeam backup server or Veeam Cloud Connect service provider in advance, before configuring the backup job. To learn more, see Connecting to Veeam Backup Server and Connecting to Service Provider.

- `<volume_to_backup>` — object that should be included in backup:
  
  - For simple volumes — name of a block device that represents a volume or an entire disk that should be included in backup. You can specify entire disk to create backup of the entire computer image or individual computer volumes to create backup of specific volumes. If you want to back-up several disks or volumes, specify them one after another using the ‘,’ (comma) character as a separator.
NOTE:
If you include a block device in the backup, and this block device is a physical volume assigned to an LVM volume group, Veeam Agent will include the whole LVM volume group in the backup.

- For LVM volumes — name of an LVM logical volume that should be included in backup. If you want to back-up several LVM logical volumes, specify them one after another using the ',' (comma) character as a separator.

- `<advanced_options>` — advanced options for the backup job. To learn more, see Advanced Backup Job Settings.
- `<schedule_options>` — schedule options for the backup job. To learn more, see Schedule Settings.
- `<active_full_backup_options>` — active full backup schedule options for the backup job. To learn more, see Active Full Backup Schedule Settings.
- `<indexing_options>` — file system indexing options for the backup job. To learn more, see File System Indexing Settings.

For example:

```
$ veeamconfig job create --name SystemBackup --reponame Repository_01 --objects /dev/sda1 --weekdays Mon,Sun --weekdays-full Thu
```

TIP:
Consider the following:

- You can also specify backup schedule for the backup job after your create the backup job. For details, see Configuring Backup Schedule.
- You can also specify active full backup schedule for the backup job after your create the backup job. For details, see Configuring Active Full Backup Schedule.
- You can also specify database processing settings for the volume-level backup job. For details, see Configuring Database Processing Settings.

Advanced Backup Job Settings

You can specify the following advanced options for the backup job:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description and values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--compressionlevel</code></td>
<td>Data compression level. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• 0 — No compression</td>
</tr>
<tr>
<td></td>
<td>• 1 — Rle</td>
</tr>
<tr>
<td></td>
<td>• 2 — Lz4</td>
</tr>
<tr>
<td></td>
<td>• 3 — ZLibLow</td>
</tr>
<tr>
<td></td>
<td>• 4 — ZLibHigh</td>
</tr>
<tr>
<td>Option</td>
<td>Description and values</td>
</tr>
<tr>
<td>------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>--blocksize</td>
<td>Data block size in kilobytes. Possible values are 256, 512, 1024 or 4096.</td>
</tr>
<tr>
<td>--maxpoints</td>
<td>The number of restore points that you want to store in the backup location. By default, Veeam Agent for Linux keeps 7 latest restore points. When the new restore point that exceeds the specified number is created, Veeam Agent for Linux will remove the earliest restore point from the backup chain.</td>
</tr>
<tr>
<td>--prefreeze</td>
<td>Path to the script that should be executed before the snapshot creation. This option is available only if Veeam Agent for Linux operates in the Server edition. To learn about editions, see Product Editions.</td>
</tr>
<tr>
<td>--postthaw</td>
<td>Path to the script that should be executed after the snapshot creation. This option is available only if Veeam Agent for Linux operates in the Server edition. To learn about editions, see Product Editions.</td>
</tr>
<tr>
<td>--prejob</td>
<td>Path to the script that should be executed at the start of the backup job.</td>
</tr>
<tr>
<td>--postjob</td>
<td>Path to the script that should be executed after the backup job completes.</td>
</tr>
<tr>
<td>--setencryption</td>
<td>Defines that data encryption option is enabled for the job. When you use the veeamconfig job create command with the --setencryption option, Veeam Agent for Linux will prompt you to specify a password for data encryption and hint for the password.</td>
</tr>
<tr>
<td>--deleteold</td>
<td>The number of days to keep the backup created with the backup job in the target location. If Veeam Agent for Linux does not create new restore points for the backup, the backup will remain in the target location for the specified number of days. When this period is over, the backup will be removed from the target location. By default, the retention period for old backups is 30 days.</td>
</tr>
</tbody>
</table>

**Schedule Settings**

You can specify schedule options for the backup job to create backups daily or on specific weekdays at specific time:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description and values</th>
</tr>
</thead>
<tbody>
<tr>
<td>--daily</td>
<td>Defines that the backup job must start daily at specific time.</td>
</tr>
</tbody>
</table>
### Option: --weekdays

Weekdays when the backup job must start separated by a comma (','). Possible values are:

- *Mon* — Monday
- *Tue* — Tuesday
- *Wed* — Wednesday
- *Thu* — Thursday
- *Fri* — Friday
- *Sat* — Saturday
- *Sun* — Sunday

### Option: --at

Time of day when the backup job must start specified in the *HH:MM* format. For example: 20:00.

After the backup job is created, Veeam Agent for Linux automatically enables backup schedule. To learn about how to configure backup schedule for an existing backup job, see Configuring Backup Schedule.

### Active Full Backup Schedule Settings

You can specify schedule options for the backup job to create active full backups on specific weekdays or days of the month:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description and values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>--weekdays-full</strong></td>
<td>Weekdays when the backup job must create an active full backup separated by a comma (','). Possible values are:</td>
</tr>
<tr>
<td></td>
<td>- <em>Mon</em> — Monday</td>
</tr>
<tr>
<td></td>
<td>- <em>Tue</em> — Tuesday</td>
</tr>
<tr>
<td></td>
<td>- <em>Wed</em> — Wednesday</td>
</tr>
<tr>
<td></td>
<td>- <em>Thu</em> — Thursday</td>
</tr>
<tr>
<td></td>
<td>- <em>Fri</em> — Friday</td>
</tr>
<tr>
<td></td>
<td>- <em>Sat</em> — Saturday</td>
</tr>
<tr>
<td></td>
<td>- <em>Sun</em> — Sunday</td>
</tr>
<tr>
<td><strong>--thisday-full</strong></td>
<td>Days of the month when the backup job must create an active full backup separated by a comma (','). Possible values are: 1-30 (or 1-31, depending on the month length).</td>
</tr>
</tbody>
</table>

After the backup job is created, Veeam Agent for Linux automatically enables active full backup schedule. To learn about how to configure active full backup schedule for an existing backup job, see Configuring Active Full Backup Schedule.
## File System Indexing Settings

You can specify one of the following file system indexing options for the backup job:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description and values</th>
</tr>
</thead>
<tbody>
<tr>
<td>--indexall</td>
<td>Defines that Veeam Agent for Linux must index all files on the volumes included in backup.</td>
</tr>
<tr>
<td>--indexonly</td>
<td>Path to a directory that contains files that you want to index. Enter paths to the necessary directories. To separate several paths, use the ',' (comma) character.</td>
</tr>
<tr>
<td>--indexexcept</td>
<td>Path to a directory that contains files that you do not want to index. You can specify one or more paths. To separate several paths, use the ',' (comma) character.</td>
</tr>
</tbody>
</table>

To learn more about file indexing, see [File System Indexing](#).

## Creating File-Level Backup Job

To create a file-level backup job, use the following command:

```
veeamconfig job create filelevel --name <job_name> --reponame <repository_name> <objects> <advanced_options> <schedule_options> <active_full_backup_options> <indexing_options> --nosnap
```

where:

- `<job_name>` — name for the created backup job.
- `<repository_name>` — name of the backup repository that should be used as a target location for the backup job. The backup repository must be created in advance. To learn more, see [Creating Backup Repository](#).
  
  If you want to create Veeam Agent backups in the Veeam backup repository, you should connect to the Veeam backup server in advance, before configuring the backup job. To learn more, see [Connecting to Veeam Backup Server](#).
- `<objects>` — files and directories inclusion/exclusion options. To learn more, see [File Inclusion Options](#).
- `<advanced_options>` — advanced options for the backup job. To learn more, see [Advanced Backup Job Settings](#).
- `<schedule_options>` — schedule options for the backup job. To learn more, see [Schedule Settings](#).
- `<active_full_backup_options>` — active full backup schedule options for the backup job. To learn more, see [Active Full Backup Schedule Settings](#).
- `<indexing_options>` — file system indexing options for the backup job. To learn more, see [File System Indexing Settings](#).
• **--nosnap** — option that instructs Veeam Agent for Linux to perform backup in the snapshot-less mode. With this option enabled, Veeam Agent for Linux will not create a snapshot of the backed-up volumes during backup. This allows Veeam Agent to back up data residing in file systems that are not supported for snapshot-based backup with Veeam Agent for Linux. Keep in mind that the snapshot-less file-level backup does not guarantee that data in the backup is consistent. To learn more, see [Snapshot-Less File-Level Backup](#).

For example:

```bash
$ veeamconfig job create filelevel --name HomeFolderBackup --reponame NetworkRepository --includedirs /home/user --excludedirs /home/user/temp --excludemasks *.pdf
```

**TIP:**
Consider the following:

- You can also specify backup schedule for the backup job after your create the backup job. For details, see [Configuring Backup Schedule](#).
- You can also specify active full backup schedule for the backup job after your create the backup job. For details, see [Configuring Active Full Backup Schedule](#).

### File Inclusion Options

When you create a file-level backup job, you must specify at least one directory that should be included in backup. If you do not want to back up some files and directories in the specified directory, you can exclude specific files and directories from backup.

To define the backup scope for the file-level backup job, you can use the following command-line options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description and values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>--includedirs</strong></td>
<td>Full path to a directory that should be included in backup, for example: <code>/home/user</code>. You can specify one or several paths to directories in the computer file system. To separate several paths, use the <code>,' (comma) character, for example: </code>/home/user/Documents, /home/user/reports`.</td>
</tr>
<tr>
<td><strong>--excludedirs</strong></td>
<td>Full path to a directory that should be excluded from backup. The directory specified with this option must be a subdirectory of the directory specified with the <strong>--includedirs</strong> option. To separate several paths, use the <code>,' (comma) character, for example, </code>/home/user/Documents, /home/user/reports`.</td>
</tr>
<tr>
<td>Option</td>
<td>Description and values</td>
</tr>
<tr>
<td>---------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>--includemasks</td>
<td>Mask for file name or path that should be included in backup. You can use the following UNIX wildcard characters for file name masks:</td>
</tr>
<tr>
<td></td>
<td>• '*' — a substitution for one or more characters in the file name or path. Can be used for any sequence of characters (including no characters). For example, '*.pdf.'</td>
</tr>
<tr>
<td></td>
<td>• '?': — a substitution of one character in the file name or path. For example, report?.pdf.</td>
</tr>
<tr>
<td></td>
<td>• '[]': — a substitution of one character in the file name or path with any of the characters enclosed in square brackets (or a range of characters defined with the '-' character). For example: report_20[1][3456].pdf or report_20[1][3-6].pdf.</td>
</tr>
<tr>
<td></td>
<td>Keep in mind that you must specify all names with masks in double quotation marks (&quot;&quot;). For example: --includemasks &quot;*.bak&quot;.</td>
</tr>
<tr>
<td></td>
<td>If you want to use several file name masks, you must specify them in double quotation marks (&quot;&quot;%) and separated with a comma (,). For example: --includemasks &quot;<em>.bak,</em>.pdf&quot;.</td>
</tr>
<tr>
<td></td>
<td>File inclusion option is applied to all directories that are specified with the --includedirs option. For example, if you include in backup the /home/user/Documents directory and files that match the repor?.pdf file name mask, Veeam Agent for Linux will back up the /home/user/Documents/report.pdf file and will not back up the /home/user/reports/report.pdf file.</td>
</tr>
</tbody>
</table>
Option | Description and values
--- | ---
--excludemasks | Mask for file name or path that should be excluded from backup. You can use the following UNIX wildcard characters for file name masks:

- ‘*’ — a substitution for one or more characters in the file name or path. Can be used for any sequence of characters (including no characters). For example, ".pdf.
- ‘?’ — a substitution of one character in the file name or path. For example, `report?.pdf`.
- ‘[]’ — a substitution of one character in the file name or path with any of the characters enclosed in square brackets (or a range of characters defined with the ‘-’ character). For example: `report_201[3456].pdf` or `report_201[3-6].pdf`.

Keep in mind that you must specify all names with masks in double quotation marks (" "). For example: `--excludemasks "*.bak"`.

If you want to use several file name masks, you must specify them in double quotation marks (" ") and separated with a comma (,). For example: `--excludemasks "*.bak,*.pdf"`.

File exclusion option is applied to all directories that are specified with the --includedirs option and files that match file name masks specified with the --excludemasks option. For example, you may want to specify the following backup scope for the backup job:

- Include in backup the `/home/user/Documents` directory
- Include files that match the `report.*` file name mask
- Exclude files that match the `*.odt` file name mask.

In this case, Veeam Agent for Linux will back up the `/home/user/Documents/report.pdf` file and will not back up `/home/user/Documents/report.odt` and `/home/user/reports/report.pdf` files.

Advanced Backup Job Settings

You can specify the following advanced options for the backup job:

Option | Description and values
--- | ---
--compressionlevel | Data compression level. Possible values are:

- 0 — No compression
- 1 — Rle
- 2 — Lz4
- 3 — ZlibLow
- 4 — ZlibHigh
### Option Description and values

<table>
<thead>
<tr>
<th>Option</th>
<th>Description and values</th>
</tr>
</thead>
<tbody>
<tr>
<td>--blocksize</td>
<td>Data block size in kilobytes. Possible values are 256, 512, 1024 or 4096.</td>
</tr>
<tr>
<td>--maxpoints</td>
<td>The number of restore points that you want to store in the backup location. By default, Veeam Agent for Linux keeps 7 latest restore points. When the new restore point that exceeds the specified number is created, Veeam Agent for Linux will remove the earliest restore point from the backup chain.</td>
</tr>
<tr>
<td>--prefreeze</td>
<td>Path to the pre-freeze script that should be executed before the snapshot creation. This option is available only if Veeam Agent for Linux operates in the Server edition. To learn about editions, see <a href="#">Product Editions</a>.</td>
</tr>
<tr>
<td>--postthaw</td>
<td>Path to the post-thaw script that should be executed after the snapshot creation. This option is available only if Veeam Agent for Linux operates in the Server edition. To learn about editions, see <a href="#">Product Editions</a>.</td>
</tr>
<tr>
<td>--prejob</td>
<td>Path to the script that should be executed at the start of the backup job.</td>
</tr>
<tr>
<td>--postjob</td>
<td>Path to the script that should be executed after the backup job completes.</td>
</tr>
<tr>
<td>--setencryption</td>
<td>Defines that data encryption option is enabled for the job. When you use the <code>veeamconfig job create</code> command with the <code>--setencryption</code> option, Veeam Agent for Linux will prompt you to specify a password for data encryption and hint for the password.</td>
</tr>
<tr>
<td>--deleteold</td>
<td>The number of days to keep the backup created with the backup job in the target location. If Veeam Agent for Linux does not create new restore points for the backup, the backup will remain in the target location for the specified number of days. When this period is over, the backup will be removed from the target location. By default, the retention period for old backups is 30 days.</td>
</tr>
</tbody>
</table>

### Schedule Settings

You can specify schedule options for the backup job to create backups daily or on specific weekdays at specific time:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description and values</th>
</tr>
</thead>
<tbody>
<tr>
<td>--daily</td>
<td>Defines that the backup job must start daily at specific time.</td>
</tr>
<tr>
<td>Option</td>
<td>Description and values</td>
</tr>
<tr>
<td>-------------</td>
<td>----------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>--weekdays</td>
<td>Weekdays when the backup job must start separated by a comma (','). Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• Mon — Monday</td>
</tr>
<tr>
<td></td>
<td>• Tue — Tuesday</td>
</tr>
<tr>
<td></td>
<td>• Wed — Wednesday</td>
</tr>
<tr>
<td></td>
<td>• Thu — Thursday</td>
</tr>
<tr>
<td></td>
<td>• Fri — Friday</td>
</tr>
<tr>
<td></td>
<td>• Sat — Saturday</td>
</tr>
<tr>
<td></td>
<td>• Sun — Sunday</td>
</tr>
<tr>
<td>--at</td>
<td>Time of day when the backup job must start specified in the \textit{HH:MM} format. For example: 20:00.</td>
</tr>
</tbody>
</table>

After the backup job is created, Veeam Agent for Linux automatically enables backup schedule. To learn about how to configure backup schedule for an existing backup job, see Configuring Backup Schedule.

### Active Full Backup Schedule Settings

You can specify schedule options for the backup job to create active full backups on specific weekdays or days of the month:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description and values</th>
</tr>
</thead>
<tbody>
<tr>
<td>--weekdays-full</td>
<td>Weekdays when the backup job must create an active full backup separated by a comma (','). Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• Mon — Monday</td>
</tr>
<tr>
<td></td>
<td>• Tue — Tuesday</td>
</tr>
<tr>
<td></td>
<td>• Wed — Wednesday</td>
</tr>
<tr>
<td></td>
<td>• Thu — Thursday</td>
</tr>
<tr>
<td></td>
<td>• Fri — Friday</td>
</tr>
<tr>
<td></td>
<td>• Sat — Saturday</td>
</tr>
<tr>
<td></td>
<td>• Sun — Sunday</td>
</tr>
<tr>
<td>--thisday-full</td>
<td>Days of the month when the backup job must create an active full backup separated by a comma (','). Possible values are: 1-30 (or 1-31, depending on the month length).</td>
</tr>
</tbody>
</table>

After the backup job is created, Veeam Agent for Linux automatically enables active full backup schedule. To learn about how to configure active full backup schedule for an existing backup job, see Configuring Active Full Backup Schedule.
File System Indexing Settings

You can specify the following file system indexing option for the backup job:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description and values</th>
</tr>
</thead>
<tbody>
<tr>
<td>--indexall</td>
<td>Defines that Veeam Agent for Linux must index all files in the directories included in backup.</td>
</tr>
</tbody>
</table>

To learn more about file indexing, see File System Indexing.

Configuring Backup Schedule

To run a backup job periodically without the user intervention, you can schedule it to start automatically. You can specify schedule settings individually for every job created in Veeam Agent for Linux. You can perform the following actions with the backup job schedule via the command-line interface:

- Specify schedule settings for the job.
- Enable schedule for the job.
- View the schedule defined for the job.
- Disable schedule for the job.

TIP:

You can also specify backup schedule for the backup job when you create the job. For details, see Creating Volume-Level Backup Job and Creating File-Level Backup Job.

Specifying Backup Schedule

You can schedule a backup job to start at specific time daily or on specific week days.

Specifying Daily Schedule

To specify daily schedule settings for the backup job, use the following command:

```
veeamconfig schedule set --jobId <job_id> --daily --at <time>
```

or

```
veeamconfig schedule set --jobName <job_name> --daily --at <time>
```

where:

- `<job_id>` — ID of the backup job for which you want to configure the schedule. You should look up the job ID in advance, before configuring the schedule, for example, with the `veeamconfig job list` command. To learn more, see Viewing List of Backup Jobs.
• <job_name> — name of the backup job for which you want to configure the schedule.

TIP:

To view IDs or names of all existent backup jobs, you can press the Tab key right after you type the --jobId or --jobName option.

• <time> — time of day when the backup job must start specified in the HH:MM format. For example: 20:00.

For example:

```
user@srv01:~$ veeamconfig schedule set --jobId 4849a3ae-1935-4969-98a3-d8acd2f6c73f --daily --at 20:00
```

Specifying Schedule on Specific Days

To specify schedule settings for the backup job, use the following command:

```
veeamconfig schedule set --jobId <job_id> --weekdays <days> --at <time>
```

or

```
veeamconfig schedule set --jobName <job_name> --weekdays <days> --at <time>
```

where:

• <job_id> — ID of the backup job for which you want to configure the schedule. You should look up the job ID in advance, before configuring the schedule, for example, with the veeamconfig job list command. To learn more, see Viewing List of Backup Jobs.

• <job_name> — name of the backup job for which you want to configure the schedule.

TIP:

To view IDs or names of all existent backup jobs, you can press the Tab key right after you type the --jobId or --jobName option.

• <days> — days when the backup job must start separated by a comma (','). For example: Monday,Tuesday,Wednesday,Thursday,Friday.

• <time> — time of day when the backup job must start specified in the HH:MM format. For example: 20:00.

For example:

```
user@srv01:~$ veeamconfig schedule set --jobName DailyBackup --weekdays Monday, Tuesday, Wednesday, Thursday, Friday --at 20:00
```
Enabling Backup Schedule

To run a backup job automatically upon the defined schedule, you must enable the schedule for the job. Use the following command:

```
veeamconfig schedule enable --jobId <job_id>
```

or

```
veeamconfig schedule enable --jobName <job_name>
```

where:
- `<job_id>` — ID of the backup job for which you want to enable the schedule. You should look up the job ID in advance, for example, with the veeamconfig job list command. To learn more, see Viewing List of Backup Jobs.
- `<job_name>` — name of the backup job for which you want to enable the schedule.

For example:

```
user@srv01:~$ veeamconfig schedule enable --jobId 4849a3ae-1935-4969-98a3-d8acd2f6c73f
```

You can disable the schedule for the job at any time. To learn more, see Disabling Backup Schedule.

Viewing Backup Schedule

To view the schedule defined for the backup job, use the following command:

```
veeamconfig schedule show --jobId <job_id>
```

or

```
veeamconfig schedule show --jobName <job_name>
```

where:
- `<job_id>` — ID of the backup job for which you want to view the schedule.
- `<job_name>` — name of the backup job for which you want to view the schedule.

Veeam Agent for Linux displays the following information about the backup job schedule:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Days</td>
<td>Days on which the backup job runs automatically.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>At</td>
<td>Time of day when the backup job starts automatically.</td>
</tr>
<tr>
<td>Run automatically</td>
<td>State of backup schedule. Possible values:</td>
</tr>
<tr>
<td></td>
<td>• Enabled</td>
</tr>
<tr>
<td></td>
<td>• Disabled</td>
</tr>
</tbody>
</table>

For example:

```
user@srv01:~$ veeamconfig schedule show --jobId 4849a3ae-1935-4969-98a3-d8acd2f6c73f
Days: Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday
At: 20:00
Run automatically: enabled
```

Disabling Backup Schedule

To disable the schedule for the backup job, use the following command:

```
veeamconfig schedule disable --jobId <job_id>
```

or

```
veeamconfig schedule disable --jobName <job_name>
```

where:

- `<job_id>` — ID of the backup job for which you want to disable the schedule.
- `<job_name>` — name of the backup job for which you want to disable the schedule.

For example:

```
user@srv01:~$ veeamconfig schedule disable --jobId 4849a3ae-1935-4969-98a3-d8acd2f6c73f
```

Configuring Active Full Backup Schedule

You can schedule a backup job to create active full backups periodically. You can specify active full schedule settings individually for every job created in Veeam Agent for Linux. You can perform the following actions with the active full backup schedule via the command-line interface:

- Specify active full backup schedule.
- Enable active full backup schedule.
• View active full backup schedule.
• Disable active full backup schedule.

**TIP:**
You can also specify active full backup schedule for the backup job when you create the job. For details, see *Creating Volume-Level Backup Job* and *Creating File-Level Backup Job*.

### Specifying Active Full Backup Schedule
You can schedule a backup job to create active full backups on a specific day of the month or on specific week days.

### Specifying Monthly Active Full Backup Schedule
To instruct Veeam Agent to perform active full backup on a specific day of the month, use the following command:

```
veeamconfig schedule activefull set --jobId <job_id> --thisday <day>
```

or

```
veeamconfig schedule activefull set --jobName <job_name> --thisday <day>
```

where:

- `<job_id>` — ID of the backup job for which you want to configure the active full backup schedule. You should look up the job ID in advance, before configuring the schedule, for example, with the `veeamconfig job list` command. To learn more, see *Viewing List of Backup Jobs*.
- `<job_name>` — name of the backup job for which you want to configure the active full backup schedule.

**TIP:**
To view IDs or names of all existent backup jobs, you can press the **Tab** key right after you type the `--jobId` or `--jobName` option.

- `<day>` — number of the day of the month when Veeam Agent must perform active full backup.

For example:

```
user@srv01:~$ veeamconfig schedule activefull set --jobName DailyBackup --thisday 1
```
Specifying Weekly Active Full Backup Schedule

To instruct Veeam Agent to perform active full backup on specific week days, use the following command:

```bash
veeamconfig schedule activefull set --jobId <job_id> --weekdays <days>
```

or

```bash
veeamconfig schedule activefull set --jobName <job_name> --weekdays <days>
```

where:

- `<job_id>` — ID of the backup job for which you want to configure the active full backup schedule. You should look up the job ID in advance, before configuring the schedule, for example, with the `veeamconfig job list` command. To learn more, see Viewing List of Backup Jobs.

- `<job_name>` — name of the backup job for which you want to configure the active full backup schedule.

**TIP:**

To view IDs or names of all existent backup jobs, you can press the `Tab` key right after you type the `--jobId` or `--jobName` option.

- `<days>` — days when the backup job must create an active full backup separated by a comma (`,`). For example: `Monday,Friday`. The backup job will create an active full backup on the specified days at the time specified in the backup job schedule settings.

For example:

```bash
user@srv01:~$ veeamconfig schedule activefull set --jobName DailyBackup --weekdays Monday,Friday
```

Enabling Active Full Backup Schedule

After you specify active full backup schedule settings for the backup job, Veeam Agent automatically enables active full backup schedule for the job. You can also enable active full backup schedule manually, for example, if you previously disabled it for the backup job. To enable active full backup schedule, use the following command:

```bash
veeamconfig schedule activefull enable --jobId <job_id>
```

or

```bash
veeamconfig schedule activefull enable --jobName <job_name>
```
where:

- `<job_id>` — ID of the backup job for which you want to enable the active full backup schedule. You should look up the job ID in advance, for example, with the `veeamconfig job list` command. To learn more, see Viewing List of Backup Jobs.

- `<job_name>` — name of the backup job for which you want to enable the active full backup schedule.

For example:

```
user@srv01:~$ veeamconfig schedule activefull enable --jobName DailyBackup
```

You can disable the schedule for the job at any time. To learn more, see Disabling Backup Schedule.

### Viewing Active Full Backup Schedule

To view the active full backup schedule defined for the backup job, use the following command:

```
veeamconfig schedule activefull show --jobId <job_id>
```

or

```
veeamconfig schedule activefull show --jobName <job_name>
```

where:

- `<job_id>` — ID of the backup job for which you want to view the active full backup schedule.

- `<job_name>` — name of the backup job for which you want to view the active full backup schedule.

Veeam Agent for Linux displays the following information about the active full backup schedule:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Every <code>&lt;value&gt;</code></strong></td>
<td>Days on which the backup job creates active full backups. For example: Every Monday or Every 1 day of every month.</td>
</tr>
<tr>
<td><strong>Run automatically</strong></td>
<td>State of the active full backup schedule. Possible values:</td>
</tr>
<tr>
<td></td>
<td>• Enabled</td>
</tr>
<tr>
<td></td>
<td>• Disabled</td>
</tr>
</tbody>
</table>

For example:

```
user@srv01:~$ veeamconfig schedule activefull show --jobName DailyBackup
Every Monday
Run automatically: enabled
```
Disabling Active Full Backup Schedule

To disable the active full backup schedule for the backup job, use the following command:

```
veeamconfig schedule activefull disable --jobId <job_id>
```

or

```
veeamconfig schedule activefull disable --jobName <job_name>
```

where:
- `<job_id>` — ID of the backup job for which you want to disable the active full backup schedule.
- `<job_name>` — name of the backup job for which you want to disable the active full backup schedule.

For example:

```
user@srv01:~$ veeamconfig schedule activefull disable --jobName DailyBackup
```

Configuring Database Processing Settings

You can enable database processing settings in the properties of a volume-level backup job configured in Veeam Agent for Linux. With database processing settings enabled, Veeam Agent will create transactionally consistent backups of Veeam Agent machines that run database systems.

You can perform the following actions with database processing settings via the command-line interface:

- Specify Oracle database processing settings
- Specify MySQL database processing settings
- Specify PostgreSQL database processing settings
- View database processing settings
- Disable database processing settings

Specifying Oracle Processing Settings

You can enable Oracle processing settings in the properties of a volume-level backup job configured in Veeam Agent for Linux.

To enable Oracle processing settings for the backup job, use the following command:

```
veeamconfig aap set oracle --jobId <job_id> <oracle_options>
```
or

```
veeamconfig aap set oracle --jobName <job_name> <oracle_options>
```

where:

- `<job_id>` — ID of the backup job for which you want to enable Oracle processing settings. You should look up the job ID in advance, before configuring Oracle processing settings, for example, with the `veeamconfig job list` command. To learn more, see Viewing List of Backup Jobs.

- `<job_name>` — name of the backup job for which you want to enable Oracle processing settings.

- `<oracle_options>` — Oracle processing settings for the backup job. To learn more, see Oracle Processing Settings.

**TIP:**

To view IDs or names of all existent backup jobs, you can press the Tab key right after you type the `--jobId` or `--jobName` option.

## Oracle Processing Settings

You can specify the following Oracle processing settings for the backup job:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description and values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--tryProcess</code></td>
<td>Defines that Veeam Agent must continue the backup process if errors occur when processing the Oracle database system. If you do not specify this option, Veeam Agent will stop the backup process if an error occurs when processing the Oracle database system.</td>
</tr>
<tr>
<td><code>--pruneLogs</code></td>
<td>The number of hours to keep Oracle archived logs or the size of archived logs to keep.</td>
</tr>
<tr>
<td></td>
<td>- If you want Veeam Agent to delete archived logs that are older than <code>&lt;N&gt;</code> hours, specify the necessary value in the <code>&lt;N&gt;H</code> format. For example, <code>10H</code>.</td>
</tr>
<tr>
<td></td>
<td>- If you want Veeam Agent to delete archived logs that are larger than <code>&lt;N&gt;</code> GB, specify the necessary value in the <code>&lt;N&gt;G</code> format. For example: <code>10G</code>.</td>
</tr>
<tr>
<td></td>
<td>Veeam Agent will wait for the backup job to complete successfully and then trigger archived logs truncation via Oracle Call Interface (OCI). If the backup job fails, the logs will remain untouched until the next successful backup job session.</td>
</tr>
<tr>
<td><code>--usrOracleos</code></td>
<td>Name of the Veeam Agent machine OS account. To connect to the Oracle database system, the account must be a member of the group that owns Oracle database files. You do not need this option if you want to use the Oracle account to connect to the database. Instead, specify the necessary account with the <code>--usroracledb</code> option.</td>
</tr>
</tbody>
</table>
### Option

<table>
<thead>
<tr>
<th>Option</th>
<th>Description and values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--usrOracledb</code></td>
<td>Name of the Oracle account. To connect to the Oracle database system, the account must</td>
</tr>
<tr>
<td></td>
<td>have SYSDBA rights on the databases to be processed.</td>
</tr>
<tr>
<td></td>
<td>You do not need this option if you want to use the OS account to connect to the database.</td>
</tr>
<tr>
<td></td>
<td>Instead, specify the necessary account with the <code>--usroracleos</code> option.</td>
</tr>
</tbody>
</table>

For example:

```
user@srv01:~$ veeamconfig aap set oracle --jobId 29bc2e1a-e35c-4efb-8d37-b7177b8ea75 --tryProcess --pruneLogs 10G --usrOracledb system
```

### Specifying MySQL Processing Settings

You can enable MySQL processing settings in the properties of a volume-level backup job configured in Veeam Agent for Linux.

**IMPORTANT!**

To process the MySQL database system, the MySQL account must have the following privileges:

- SELECT for all tables. If you do not have the SELECT privilege for the table, Veeam Agent does not process the table.
- LOCK TABLES. If you do not have the LOCK TABLES privilege, Veeam Agent does not process MyISAM tables.

To obtain information about privileges that are assigned to the account, use MySQL functionality, for example, the SHOW GRANTS statement. To learn more, see MySQL documentation.

To enable MySQL processing settings for the backup job, use the following command:

```
veeamconfig aap set mysql --jobId <job_id> <mysql_options>
```

or

```
veeamconfig aap set mysql --jobName <job_name> <mysql_options>
```

where:

- `<job_id>` — ID of the backup job for which you want to enable MySQL processing settings. You should look up the job ID in advance, before configuring MySQL processing settings, for example, with the `veeamconfig job list` command. To learn more, see Viewing List of Backup Jobs.
- `<job_name>` — name of the backup job for which you want to enable MySQL processing settings.
- `<mysql_options>` — MySQL processing settings for the backup job. To learn more, see MySQL Processing Settings.
### TIP:
To view IDs or names of all existent backup jobs, you can press the **Tab** key right after you type the `--jobId` or `--jobName` option.

## MySQL Processing Settings
You can specify the following MySQL processing settings for the backup job:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description and values</th>
</tr>
</thead>
<tbody>
<tr>
<td>--tryProcess</td>
<td>Defines that Veeam Agent must continue the backup process if errors occur when processing the MySQL database system. If you do not specify this option, Veeam Agent will stop the backup process if an error occurs when processing the MySQL database system.</td>
</tr>
<tr>
<td>--usrMysqlDb</td>
<td>Name of the MySQL account. Veeam Agent can connect to the MySQL database system in one of the following ways:&lt;br&gt;• If you specify account name (<strong>--usrMysqlDb</strong> option) only, Veeam Agent will prompt you to specify a password to access the MySQL database system.&lt;br&gt;• If you specify account name and password (<strong>--usrMysqlDb</strong> and <strong>--password</strong> options), Veeam Agent will access the MySQL database system.&lt;br&gt;• If you do not specify account credentials (<strong>--usrMysqlDb</strong> and <strong>--password</strong> options), Veeam Agent will use a password file to connect to the MySQL database system. To learn more about password file configuration, see <a href="#">Preparing Password File for MySQL Processing</a>.</td>
</tr>
<tr>
<td>--password</td>
<td>Password of the MySQL account. If you do not specify the <strong>--password</strong> value, Veeam Agent will prompt you to specify a password to access the MySQL database. Keep in mind, if you specify the password using the <strong>--password</strong> option, password is stored in terminal in plain text.</td>
</tr>
<tr>
<td>--defaults-file</td>
<td>Path to a password file. You must specify a full path to a password file if you want Veeam Agent to use a password file located in specific directory. Specifying relative paths is not supported. With this method selected, you do not need to specify account credentials in the backup job settings. You do not need this option in the following cases:&lt;br&gt;• Veeam Agent uses account name and password that are specified in the backup job settings to connect to the MySQL database.&lt;br&gt;• Veeam Agent uses account credentials that are stored in the password file in <code>/root/.my.cnf</code>.</td>
</tr>
</tbody>
</table>
Examples

Authentication with password:

```
user@srv01:~$ veeamconfig aap set mysql --jobId 29bc2e1a-e35c-4efb-8d37-b7177b8ea75 --tryProcess --usrMysqlDb root --password P@ssw0rd
```

Authentication with password file:

```
user@srv01:~$ veeamconfig aap set mysql --jobId 29bc2e1a-e35c-4efb-8d37-b7177b8ea75 --tryProcess
--defaults-file /data/root/.my.cnf --password P@ssw0rd
```

Preparing Password File for MySQL Processing

You can use MySQL account credentials that are stored in the password file to connect Veeam Agent for Linux to the MySQL database system.

**NOTE:**

Consider the following:

- If you specify a custom path to the password file, specify a full path. Specifying relative paths is not supported.
- The password file can also contain user-specific connection settings that Veeam Agent will apply to connect to the MySQL database system. For example, if you want to connect to the MySQL database system using the custom socket, specify the socket path in the password file. To learn more, see MySQL documentation.

If you want to use a password file for authentication, create a file. By default, Veeam Agent expects the password file to have the `.my.cnf` name and to be in the home directory of the `root` user. If the password file has a custom name or is stored in another directory, you can specify a custom path.

The password file must have the following contents:

```
[client]
user=<username>
password=<password>
```

where:

- `<username>` — name of the account that Veeam Agent will use to connect to the MySQL database system.
- `<password>` — password of the account that Veeam Agent will use to connect to the MySQL database system.

For example:

```
[client]
user=root
password=P@ssw0rd
```
Specifying PostgreSQL Processing Settings

You can enable PostgreSQL processing settings in the properties of a volume-level backup job configured in Veeam Agent for Linux.

To enable PostgreSQL processing settings for the backup job, use the following command:

```bash
veeamconfig aap set postgres --jobId <job_id> <postgres_options>
```

or

```bash
veeamconfig aap set postgres --jobName <job_name> <postgres_options>
```

where:

- `<job_id>` — ID of the backup job for which you want to enable PostgreSQL processing settings. You should look up the job ID in advance, before configuring PostgreSQL processing settings, for example, with the `veeamconfig job list` command. To learn more, see Viewing List of Backup Jobs.
- `<job_name>` — name of the backup job for which you want to enable PostgreSQL processing settings.
- `<postgres_options>` — PostgreSQL processing settings for the backup job. To learn more, see PostgreSQL Processing Settings.

**TIP:**

To view IDs or names of all existent backup jobs, you can press the Tab key right after you type the `-jobId` or `-jobName` option.

### PostgreSQL Processing Settings

You can specify the following PostgreSQL processing settings for the backup job:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description and values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--tryProcess</code></td>
<td>Defines that Veeam Agent must continue the backup process if errors occur when processing the PostgreSQL database system. If you do not specify this option, Veeam Agent will stop the backup process if an error occurs when processing the PostgreSQL database system.</td>
</tr>
<tr>
<td><code>--usrPgdb</code></td>
<td>Name of the PostgreSQL account. If you uses a password file to connect to the PostgreSQL database system, the <code>--usrPgdb</code> option allows to select the user from the password file. You do not need this option if you want to use a Veeam Agent machine OS account to connect to the PostgreSQL database system. Instead, specify the OS account with the <code>--usrpgos</code> option.</td>
</tr>
<tr>
<td>Option</td>
<td>Description and values</td>
</tr>
<tr>
<td>----------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>--password</td>
<td>Password of the PostgreSQL account. If you do not specify this option, Veeam Agent will prompt to enter the password. If you do not specify the password in prompt, Veeam Agent uses a password file to connect to the PostgreSQL database system. To learn more about password file configuration, see Preparing Password File for PostgreSQL Processing. Keep in mind, if you specify the password using the --password option, password is stored in terminal in plain text.</td>
</tr>
<tr>
<td>--usrPg</td>
<td>Name of the OS account. Veeam Agent will use the name to connect to the PostgreSQL database system using the peer authentication method. In the peer authentication method, Veeam Agent uses the OS account as the PostgreSQL database user name. With this option selected, you must specify OS account only. To learn more about peer authentication, see PostgreSQL documentation. You do not need this option if you want to use a PostgreSQL account to connect to the database system. Instead, specify the PostgreSQL account with the --usrpgdb option.</td>
</tr>
</tbody>
</table>

For example:
```
user@srv01:~$ veeamconfig aap set postgres --jobId 29bc2e1a-e35c-4efb-8d37-b7177b8ea75 --tryProcess --usrPgdb postgres --password P@ssw0rd
```

Preparing Password File for PostgreSQL Processing

You can use PostgreSQL account credentials that are stored in the password file to connect Veeam Agent to the PostgreSQL database system.

If you want to use a password file for authentication, create the .pgpass file in the home directory of the root user.

The password file must have the following contents:
```
<hostname>:<port>:<database>:<username>:<password>
```
where:
- `<hostname>` — name of the host where the PostgreSQL database system is located.
- `<port>` — number of the free port that Veeam Agent will use to connect to the PostgreSQL database system.
- `<database>` — name of the PostgreSQL database.
- `<username>` — name of the account that Veeam Agent will use to connect to the PostgreSQL database system.
- `<password>` — password of the account that Veeam Agent will use to connect to the PostgreSQL database system.
For example:

```
svr01:5432:mydb:postgres:P@ssw0rd
```

For more information about the password file, see PostgreSQL documentation.

The PostgreSQL database system can use connection settings from one of the following files:

- `postgresql.conf`
- `.pgpass`

By default, Veeam Agent applies connection settings from the `postgresql.conf` file. If you specify host name and port number in the `.pgpass` file, Veeam Agent will use host name and port number from the `.pgpass` file instead of the `postgresql.conf` file to connect to the PostgreSQL database system. If you replace the value in the `.pgpass` file with the asterisk (*) sign, Veeam Agent uses the value from the `postgresql.conf` file.

For example:

```
*:*:mydb:postgres:P@ssw0rd
```

### Viewing Database Processing Settings

To view database processing settings defined for the backup job, use the following command:

```
veeamconfig aap show --jobId <job_id>
```

or

```
veeamconfig aap show --jobName <job_name>
```

where:

- `<job_id>` — ID of the backup job for which you want to view database processing settings.
- `<job_name>` — name of the backup job for which you want to view database processing settings.

Veeam Agent for Linux displays the following information about database processing settings:

- Oracle processing settings
- MySQL processing settings
- PostgreSQL processing settings
# Oracle Processing Settings

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Oracle processing</strong></td>
<td>Oracle processing settings status. Possible values:</td>
</tr>
<tr>
<td></td>
<td>• Required — Oracle processing settings are enabled for the job. If an error occurs when processing the Oracle database system, Veeam Agent will stop the backup process.</td>
</tr>
<tr>
<td></td>
<td>• Try — Oracle processing settings are enabled for the job. If an error occurs when processing the Oracle database system, Veeam Agent will continue the backup process.</td>
</tr>
<tr>
<td></td>
<td>• Disabled — Oracle processing settings are disabled for the job using command line interface.</td>
</tr>
<tr>
<td><strong>Account used for processing</strong></td>
<td>Account used to connect to the Oracle database. Possible values:</td>
</tr>
<tr>
<td></td>
<td>• System account (username: &lt;username&gt;) — if Veeam Agent connects to the Oracle database system with the account of the Veeam Agent machine OS.</td>
</tr>
<tr>
<td></td>
<td>• Oracle account (username: &lt;username&gt;) — if Veeam Agent connects to the Oracle database system with the Oracle account.</td>
</tr>
<tr>
<td></td>
<td>where &lt;username&gt; is a name of the user account that Veeam Agent will use to connect to the Oracle database.</td>
</tr>
<tr>
<td><strong>Delete logs over &lt;N&gt; Gb</strong></td>
<td>Veeam Agent displays this information if Veeam Agent is set to delete archived logs that are larger than &lt;N&gt; GB.</td>
</tr>
<tr>
<td><strong>Delete logs older &lt;N&gt; Hr</strong></td>
<td>Veeam Agent displays this information if Veeam Agent is set to delete archived logs that are older than &lt;N&gt; hours.</td>
</tr>
</tbody>
</table>

For example:

```bash
user@srv01:~$ veeamconfig aap show --jobId 29bc2e1a-e35c-4efb-8d37-b7177b8ea75
Oracle processing: required
  Account used for processing: Oracle account (username: sys)
  Delete logs over 10 Gb
```
### MySQL Processing Settings

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MySQL processing</td>
<td>MySQL processing settings status. Possible values:</td>
</tr>
<tr>
<td></td>
<td>• Required — MySQL processing settings are enabled for the job. If an error occurs when processing a MySQL database, Veeam Agent will stop the backup process.</td>
</tr>
<tr>
<td></td>
<td>• Try — MySQL processing settings are enabled for the job. If an error occurs when processing a MySQL database, Veeam Agent will continue the backup process.</td>
</tr>
<tr>
<td></td>
<td>• Disabled — MySQL processing settings are disabled for the job using command line interface.</td>
</tr>
<tr>
<td>Account used for processing</td>
<td>Veeam Agent displays this information if Veeam Agent is set to connect to the MySQL database system with the account name and password.</td>
</tr>
<tr>
<td>Path to a password file</td>
<td>Veeam Agent displays this information if Veeam Agent is set to connect to the MySQL database system with the account credentials that are stored in the password file.</td>
</tr>
</tbody>
</table>

For example:

```
user@srv01:~$ veeamconfig aap show --jobId 29bc2e1a-e35c-4efb-8d37-b7177b8ea75
MySQL processing: required
   Account used for processing: username: root
```

### PostgreSQL Processing Settings

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PostgreSQL processing</td>
<td>PostgreSQL processing settings status. Possible values:</td>
</tr>
<tr>
<td></td>
<td>• Required — PostgreSQL processing settings are enabled for the job. If an error occurs when processing a PostgreSQL database, Veeam Agent will stop the backup process.</td>
</tr>
<tr>
<td></td>
<td>• Try — PostgreSQL processing settings are enabled for the job. If an error occurs when processing a PostgreSQL database, Veeam Agent will continue the backup process.</td>
</tr>
<tr>
<td></td>
<td>• Disabled — PostgreSQL processing settings are disabled for the job using command line interface.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Account used for</td>
<td>Account used to connect to the PostgreSQL database. Possible values:</td>
</tr>
<tr>
<td>processing</td>
<td>- <code>&lt;username&gt;</code> <em>(password)</em> — Veeam Agent displays this information if Veeam Agent is set to connect to the PostgreSQL database with the PostgreSQL account.</td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;username&gt;</code> <em>(file)</em> — Veeam Agent displays this information if Veeam Agent is set to connect to the PostgreSQL database with the password file.</td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;username&gt;</code> <em>(peer)</em> — Veeam Agent displays this information if Veeam Agent is set to connect to the PostgreSQL database with the Veeam Agent machine OS account.</td>
</tr>
<tr>
<td></td>
<td>where <code>&lt;username&gt;</code> is a name of the account that Veeam Agent will use to connect to the PostgreSQL database.</td>
</tr>
</tbody>
</table>

For example:

```
user@srv01:~$ veeamconfig aap show --jobId 29bc2e1a-e35c-4efb-8d37-b7177b8ea75
PostgreSQL processing: required
Account used for processing: postgres (password)
```

### Disabling Database Processing Settings

To disable database processing settings defined for the backup job, use the following command:

```
veeamconfig aap disable <db_sys> --jobId <job_id>
```

or

```
veeamconfig aap disable <db_sys> --jobName <job_name>
```

where:

- `<db_sys>` — name of the database system that you want to disable. Possible values:
  - `oracle` — Oracle database processing to be disabled.
  - `mysql` — MySQL database processing to be disabled.
  - `postgres` — PostgreSQL database processing to be disabled.
- `<job_id>` — ID of the backup job for which you want to disable database processing settings.
- `<job_name>` — name of the backup job for which you want to disable database processing settings.
For example:

```
user@srv01:~$ veeamconfig aap disable oracle --jobId 29bc2e1a-e35c-4efb-8d37-b7177b8ea759
Oracle processing was disabled.
```
Starting and Stopping Backup Jobs

You can start a backup job manually at any time you need, for example, if you want to create an additional restore point for Veeam Agent backup and do not want to change the job schedule. You can also stop the running backup job before the job session completes, if necessary.

You can start and stop backup jobs in one of the following ways:

- With the Veeam Agent control panel
- With the Veeam Agent command line interface
Starting Backup Job from Control Panel

You can start a backup job with the Veeam Agent control panel.

**NOTE:**

Veeam Agent can currently perform only one backup job at a time. You cannot start a backup job when another backup job is already running.

To start a backup job:

1. Launch the Veeam Agent control panel with the `veeam` or `veeamconfig ui` command.
2. Press the ‘s’ key to open the **Select job to start** dialog window.
3. Select the necessary backup job in the list and start the job in one of the following ways:
   - To start an incremental backup job session, press **Enter**.
   - To create an active full backup, press ‘f’.
4. Veeam Agent will immediately start the backup job and display a notification window informing that the job has been started. Press **Enter** to close the window and proceed to the list of backup job sessions.

You can monitor the backup job performance in the Veeam Agent control panel. To learn more, see **Viewing Real-Time Job Session Statistics**.
Starting Backup Job from Command Line Interface

You can start a backup job with the command line interface. When you start a backup job, Veeam Agent initiates a new backup job session and provides you with a Session ID. You can monitor the progress of the backup job session or view the session status.

**NOTE:**
Veeam Agent can currently perform only one backup job at a time. You cannot start a backup job when another backup job is already running.

To start a backup job, use the following command:

```
veeamconfig job start --name <job_name>
```

or

```
veeamconfig job start --id <job_id>
```

where:

- `<job_name>` — name of the backup job that you want to start.
- `<job_id>` — ID of the backup job that you want to start.

**TIP:**
Consider the following:

- You can use the `veeamconfig job start` command with the `--nosnap` option to start a file-level backup job. In this case, Veeam Agent will not create a snapshot of the backed-up volume during the backup job session. Keep in mind that the snapshot-less file-level backup does not guarantee that data in the backup is consistent. To learn more, see [Snapshot-Less File-Level Backup](#).

- You can use the `veeamconfig job start` command with the `--activefull` option to create active full backups. To learn more, see [Creating Active Full Backups](#).

For example:

```
$ veeamconfig job start --name SystemBackup
Backup job has been started.
Session ID: [{381532f7-426a-4e89-b9fc-43d98942c71a}].
Logs stored in: [/var/log/veeam/Backup/SystemBackup/Session_20161207_162608_{381532f7-426a-4e89-b9fc-43d98942c71a}].
```

You can [check the backup job session status](#) or [view the backup job session log](#) using the Veeam Agent command line interface.

You can also monitor the backup job performance in the Veeam Agent control panel. To learn more, see [Viewing Real-Time Job Session Statistics](#).
Creating Active Full Backups

You can create an ad-hoc full backup — active full backup, and add it to the backup chain on the target storage. The active full backup resets the backup chain. All subsequent incremental backups use the active full backup as a starting point. The previously used full backup will remain on the target storage until it is removed from the backup chain according to the retention policy.

Before you create an active full backup, check the following prerequisites:

- The backup job must be configured.
- You cannot create an active full backup if a backup task of any type is currently running.

To perform active full backup, use the following command:

```
veeamconfig job start --name <job_name> --activefull
```

or

```
veeamconfig job start --id <job_id> --activefull
```

where:

- `<job_name>` — name of the backup job that you want to start to create an active full backup.
- `<job_id>` — ID of the backup job that you want to start to create an active full backup.

For example:

```
$ veeamconfig job start --name SystemBackup --activefull
Backup job has been started.
Session ID: [{ce864e24-8211-4df7-973a-741adce96fe7}].
Logs stored in: [/var/log/veeam/Backup/SystemBackup/Session_20180611_150046_{ce864e24-8211-4df7-973a-741adce96fe7}].
```

You can view the progress for the active full backup session in the same way as for any other backup job session. In particular, you can check the backup job session status or view the backup job session log using the Veeam Agent command line interface.

You can also monitor the backup job performance in the Veeam Agent control panel. To learn more, see Viewing Real-Time Job Session Statistics.
Stopping Backup Job

You can stop the running backup job before the job session completes, for example, if the backup process is about to take long, and you do not want the job to produce workload on the production environment during business hours.

When you stop a backup job, the job session will finish immediately. Veeam Agent will not produce a new restore point during the session, and the session will finish with the Failed status.

You can stop a job in one of the following ways:

- With the control panel
- With the command line interface

Stopping Job from Control Panel

To stop a backup job:

1. Launch the Veeam Agent control panel with the `veeam` or `veeamconfig ui` command.
2. In the Veeam Agent control panel, in the list of backup job sessions, select the currently running session with `Up` and `Down` keys and press `Enter`.
3. In the session statistics window, press 's'.
4. In the displayed window, make sure that the Yes button is selected and press `Enter`. 

---

**Backup Status: Running**

**Summary**
- Duration: 00:00:26
- Processing rate: 45.2 MB/s
- Bottleneck: Source
- Processed: 1.1 GB (19%)
- Read: 1.1 GB
- Transferred: 496.6 MB (2.2x)

**Time**
- 15:04:48: Job Backup started
- 15:04:48: Preparing to backup
- 15:04:48: Creating volume snap
- 15:04:48: Starting full backup
- 15:04:48: File system indexing
- 15:04:48: Backing up BIOS boot sector
- 15:04:49: Backing up root 1.1

</tr>
</tbody>
</table>

---

Stop the job? [Yes] [No]
Stopping Job from Command Line Interface

To stop a backup job, use the following command:

```
veeamconfig session stop --id <session_id>
```

or

```
veeamconfig session stop --force --id <session_id>
```

where:

- `<session_id>` — ID of the currently running backup job session that you want to stop.
- `--force` — with this option enabled, Veeam Agent will immediately stop the backup session even if it is unable to stop the `veeamjobman` process for some reason.

For example:

```
$ veeamconfig session stop --id 301532f7-426a-4e89-b9fc-43d9b942c71a
Session has stopped.
```
Managing Backup Jobs

You can perform the following actions with backup jobs configured in Veeam Agent for Linux:

- View the list of configured backup jobs.
- View information about the backup job settings.
- Edit the backup job settings.
- Delete a backup job.
Viewing List of Backup Jobs

To view a list of backup jobs configured in Veeam Agent for Linux, use the following command:

```bash
veeamconfig job list
```

In the list of backup jobs, Veeam Agent for Linux displays the following information:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the backup job.</td>
</tr>
<tr>
<td>ID</td>
<td>ID of the backup job.</td>
</tr>
<tr>
<td>Repository</td>
<td>Name of the backup repository that is specified as a backup storage for the backup job.</td>
</tr>
</tbody>
</table>

For example:

```bash
user@srv01:~$ veeamconfig job list
Name            ID                                      Repository
SystemBackup    {2495911e-58db-4452-b4d1-f53dcfbc600e}  Repository_1
DocumentsBackup {bcf821e6-b35f-4d57-b1c3-d3a477605cb9}  Repository_1
HomePartitionBackup {2aaa8c71-2434-4f12-a168-3d8e225fa416}  Repository_2
```
Viewing Backup Job Settings

To view detailed information about the backup jobs settings, use the following command:

```
veeamconfig job info --name <job_name>
```

or

```
veeamconfig job info --id <job_id>
```

where:

- `<job_name>` — name of the backup job for which you want to view settings.
- `<job_id>` — ID of the backup job for which you want to view settings.

Veeam Agent for Linux displays the following information about the backup job:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>ID of the backup job.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the backup job.</td>
</tr>
<tr>
<td>Repository ID</td>
<td>ID of the backup repository that is specified as a backup storage for the backup job.</td>
</tr>
<tr>
<td>Repository name</td>
<td>Name of the backup repository that is specified as a backup storage for the backup job.</td>
</tr>
<tr>
<td>Creation time</td>
<td>Date and time of the backup job creation.</td>
</tr>
<tr>
<td>Compression</td>
<td>Data compression level. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• 0 — No compression</td>
</tr>
<tr>
<td></td>
<td>• 1 — Rle</td>
</tr>
<tr>
<td></td>
<td>• 2 — Lz4</td>
</tr>
<tr>
<td></td>
<td>• 3 — ZlibLow</td>
</tr>
<tr>
<td></td>
<td>• 4 — ZlibHigh</td>
</tr>
<tr>
<td>Max Points</td>
<td>Number of restore points to keep on disk. By default, Veeam Agent for Linux keeps 7 latest restore points. When the new restore point that exceeds the specified number is created, Veeam Agent for Linux will remove the earliest restore point from the backup chain.</td>
</tr>
<tr>
<td>Index</td>
<td>File system indexing options defined for the backup job.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td><strong>Objects for backup</strong></td>
<td>Backup scope specified for the backup job.</td>
</tr>
</tbody>
</table>

For example:

```bash
user@srv01:~$ veeamconfig job info --name SystemBackup
Backup job
  ID: {2495911e-58db-4452-b4d1-f53dcfbc600e}
  Name: SystemBackup
  Repository ID: {4557ef7a-9c44-4f28-b8d0-44d78e5ddd5d}
  Repository name: Repository_1
  Creation time: 2017-04-06 13:29:03
Options:
  Compression: Lz4
  Max Points: 7
  Index all mounted filesystems on the volumes selected for backup
Objects for backup:
  Include Disk: sda1
```
Editing Backup Job Settings

If you want to change settings of the backup job, you can edit it at any time. For example, you may want to edit the backup job to add a new directory to the backup scope or change the target location.

To edit a backup job, use the following command:

**For volume-level backup jobs**

```
veeamconfig job edit volumelevel <option> for --name <job_name>
```

or

```
veeamconfig job edit volumelevel <option> for --id <job_id>
```

**For file-level backup jobs**

```
veeamconfig job edit filelevel <option> for --name <job_name>
```

or

```
veeamconfig job edit filelevel <option> for --id <job_id>
```

where:

- `<option>` — option that you want to edit for the job. You can specify one or several options at a time. To learn more about available options, see [Backup Job Options](#).
- `<job_name>` — name of the backup job that you want to edit.
- `<job_id>` — ID of the backup job that you want to edit.

For example:

```
user@srv01:$ veeamconfig job edit volumelevel --name SystemVolumeBackup for --name SystemVolume
```
## Backup Job Options

You can use the following options to edit parameters for the backup job:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description and values</th>
</tr>
</thead>
</table>
| `--compressionlevel` | Data compression level. Possible values are:  
  - 0 — No compression  
  - 1 — Rle  
  - 2 — Lz4  
  - 3 — ZlibLow  
  - 4 — ZlibHigh |
| `--maxpoints` | Number of restore points that you want to store in the backup location. By default, Veeam Agent keeps 7 latest restore points. When the new restore point that exceeds the specified number is created, Veeam Agent will remove the earliest restore point from the backup chain. |
| `--prefreeze` | Pre-freeze command that should be executed before the snapshot creation. |
| `--postthaw` | Post-thaw command that should be executed after the snapshot creation. |
| `--objects` | Object that should be included in backup:  
  - For simple volumes — name of a block device that represents a volume or an entire disk that should be included in backup. You can specify entire disk to create backup of the entire computer image or individual computer volumes to create backup of specific volumes. If you want to back-up several disks or volumes, specify them one after another using a ',' (comma) character as a separator.  
  - For LVM volumes — name of an LVM logical volume that should be included in backup. If you want to back-up several LVM logical volumes, specify them one after another using a ',' (comma) character as a separator.  

This option is available for volume-level backup jobs only. |
| `--includedirs` | Full path to a directory that should be included in backup, for example: `/home/user`. The option is available for file-level backup jobs only.  
You can specify one or several paths to directories in the computer file system. To separate several paths, use a ',' (comma) character, for example: `/home/user/Documents,/home/user/reports`. |
<table>
<thead>
<tr>
<th>Option</th>
<th>Description and values</th>
</tr>
</thead>
</table>
| **--excludedirs** | Full path to a directory that should be excluded from backup. The option is available for file-level backup jobs only.  
  The directory specified with this option must be a subdirectory of the directory specified with the **--includedirs** option. To separate several paths, use a ',' (comma) character, for example, /home/user/Documents,/home/user/reports. |
| **--includemasks** | Mask for file name or path that should be included in backup. The option is available for file-level backup jobs only.  
  You can use the following UNIX wildcard characters for file name masks:  
  - '*' — a substitution for one or more characters in the file name or path. Can be used for any sequence of characters (including no characters). For example, *.pdf.  
  - '?' — a substitution of one character in the file name or path. For example, repor?.pdf.  
  - '[]' — a substitution of one character in the file name or path with any of the characters enclosed in square brackets (or a range of characters defined with the '-' character). For example: report_201[3456].pdf or report_201[3-6].pdf.  
  To separate several masks, use a ',' (comma) character, for example, report.*,reports.*.  
  File inclusion option is applied to all directories that are specified with the **--includedirs** option. For example, if you include in backup the /home/user/Documents directory and files that match the repor?.pdf file name mask, Veeam Agent will back up the /home/user/Documents/report.pdf file and will not back up the /home/user/reports/report.pdf file. |
<table>
<thead>
<tr>
<th>Option</th>
<th>Description and values</th>
</tr>
</thead>
<tbody>
<tr>
<td>--excludemasks</td>
<td>Mask for file name or path that should be excluded from backup. The option is available for file-level backup jobs only.</td>
</tr>
<tr>
<td></td>
<td>You can use the following UNIX wildcard characters for file name masks:</td>
</tr>
<tr>
<td></td>
<td>• <code>*</code> — a substitution for one or more characters in the file name or path. Can be used for any sequence of characters (including no characters). For example, * .pdf.</td>
</tr>
<tr>
<td></td>
<td>• <code>?</code> — a substitution of one character in the file name or path. For example, report?.pdf.</td>
</tr>
<tr>
<td></td>
<td>• <code>[ ]</code> — a substitution of one character in the file name or path with any of the characters enclosed in square brackets (or a range of characters defined with the `-' character). For example: report_201[3456].pdf or report_201[3-6].pdf.</td>
</tr>
<tr>
<td></td>
<td>To separate several masks, use a <code>,</code> (comma) character, for example, report.<em>, reports.</em>.</td>
</tr>
<tr>
<td></td>
<td>File exclusion option is applied to all directories that are specified with the --includedirs option and files that match file name masks specified with the --includemasks option. For example, you may want to specify the following backup scope for the backup job:</td>
</tr>
<tr>
<td></td>
<td>• Include in backup the /home/user/Documents directory</td>
</tr>
<tr>
<td></td>
<td>• Include files that match the report.* file name mask</td>
</tr>
<tr>
<td></td>
<td>• Exclude files that match the *.odt file name mask.</td>
</tr>
<tr>
<td></td>
<td>In this case, Veeam Agent will back up the /home/user/Documents/report.pdf file and will not back up /home/user/Documents/report.odt and /home/user/reports/report.pdf files.</td>
</tr>
<tr>
<td></td>
<td>If you want to use several name masks, you must specify them in double quotation marks, for example: veeamconfig job create filelevel --name BackupJob1 --reponame vault13 --includesdirs /home --includemasks &quot;<em>.bak,</em>.pdf&quot;.</td>
</tr>
<tr>
<td>--indexnothing</td>
<td>Defines that file system indexing options are disabled for the backup job.</td>
</tr>
<tr>
<td>--indexall</td>
<td>Defines that Veeam Agent must index all files on the volumes included in backup.</td>
</tr>
<tr>
<td>--indexonly</td>
<td>Path to a directory that contains files that you want to index. Enter paths to the necessary directories. To separate several paths, use the <code>,</code> (comma) character. The option is available for volume-level backup jobs only.</td>
</tr>
<tr>
<td>--indexexcept</td>
<td>Path to a directory that contains files that you do not want to index. You can specify one or more paths. To separate several paths, use the <code>,</code> (comma) character. The option is available for volume-level backup jobs only.</td>
</tr>
<tr>
<td>Option</td>
<td>Description and values</td>
</tr>
<tr>
<td>-----------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>--setencryption</code></td>
<td>Defines that data encryption option is enabled for the job. You can use this option to enable encryption for the existing backup job or change a password used for encryption for the backup job. When you use the <code>veeamconfig job edit</code> command with the <code>--setencryption</code> option, Veeam Agent for Linux will prompt you to specify a password for data encryption and hint for the password.</td>
</tr>
<tr>
<td><code>--resetencryption</code></td>
<td>Defines that data encryption option is disabled for the job. You can use this option to disable encryption for the existing backup job.</td>
</tr>
<tr>
<td><code>--deleteold</code></td>
<td>The number of days to keep the backup created with the backup job in the target location. If Veeam Agent for Linux does not create new restore points for the backup, the backup will remain in the target location for the specified number of days. When this period is over, the backup will be removed from the target location. By default, the retention period for old backups is 30 days.</td>
</tr>
</tbody>
</table>
| `--nosnap`      | Defines whether Veeam Agent must perform backup in the snapshot-less mode. Possible values:  
  - `true` — if you use this option, Veeam Agent will create a snapshot of the backed-up volumes during file-level backup.  
  - `false` — if you use this option, Veeam Agent will not create a snapshot of the backed-up volumes during file-level backup.  
  Keep in mind that the snapshot-less file level backup does not guarantee that data in the backup is consistent. To learn more, see [Snapshot-Less File-Level Backup](#). |

**NOTE:**

Consider the following:

- If you change the target location for the backup job, during the next backup job session Veeam Agent for Linux will perform full data backup. All subsequent backup sessions will produce incremental backups — Veeam Agent for Linux will copy only changed data to the target location and add a new incremental backup file to the backup chain.

- If you change the backup scope for the backup job, during the next backup job session Veeam Agent for Linux will create a new incremental backup. The backup will contain all data blocks pertaining to new data added to the backup scope and changed data blocks pertaining to original data in the backup scope (data that was processed by the job at the time before you changed the backup scope).

- If you enable or disable encryption for the existing backup job that has already created one or more restore points, during the next job session, Veeam Agent for Linux will create active full backup. Full backup takes much more time than incremental backup. If you change the target location, you can copy an existing backup chain to the new location manually. In this case, the new backup job session will produce an incremental backup file and add it to the backup chain.
Deleting Backup Job

You can delete a backup job configured in Veeam Agent for Linux. When you delete a backup job, backup files created by this job remain intact on the backup repository.

You can delete backup jobs in one of the following ways:

- With the Veeam Agent for Linux control panel
- With the Veeam Agent for Linux command line interface

Deleting Backup Job with Control Panel

You can delete a backup job with the Veeam Agent control panel.

To delete a backup job:

1. Launch the Veeam Agent control panel with the `veeam` or `veeamconfig ui` command.
2. Press the ‘c’ key to open the Select job to configure dialog window or the ‘s’ key to open the Select job to start dialog window.
3. Select the necessary backup job in the list and press **Delete**.
4. In the displayed notification window, make sure that the **Yes** button is selected and press **Enter**.
Deleting Backup Job with Command Line Interface

You can delete a backup job with the Veeam Agent command line interface. To delete a backup job, use the following command:

```bash
veeamconfig job delete --name <job_name>
```

or

```bash
veeamconfig job delete --id <job_id>
```

where:
- `<job_name>` — name of the backup job that you want to delete.
- `<job_id>` — ID of the backup job that you want to delete.

For example:

```bash
$ veeamconfig job delete --name SystemBackup
```
Managing Backup Repositories

A backup repository is a storage location where Veeam Agent for Linux keeps backup files. You can use the following types of disk-based storage as a target location for a backup job:

- Local (internal) storage of the protected machine (not recommended).
- Direct attached storage (DAS), such as USB, eSATA or Firewire external drives.
- Network Attached Storage (NAS) able to represent itself as SMB (CIFS) or NFS share.
- Veeam Backup & Replication 11 backup repository.
- Veeam Backup & Replication 11 cloud repository.
Creating Backup Repository

Veeam Agent for Linux creates backup files in a backup repository. When you create a backup job with the Backup Job wizard, you must specify a target location for the backup. Veeam Agent will create a backup repository in the specified location and save information about this repository in the database.

**IMPORTANT!**

A backup repository must be created on a separate volume from a volume whose data you plan to back up.

If you want to create backups in local directory or network shared folder, you must create a repository. To learn more, see the following sections:

- Creating a repository in a local directory
- Creating a repository in an NFS network shared folder
- Creating a repository in an SMB network shared folder

If you want to create Veeam Agent backups in a Veeam backup repository of cloud repository, you do not need to create repositories. Before configuring the backup job, you need to connect to the Veeam backup server or Veeam Cloud Connect service provider. To learn more, see the following sections:

- Connecting to Veeam Backup Server
- Connecting to Service Provider

Creating Repository in Local Directory

To create a repository in a local directory, use the following command:

```
veeamconfig repository create --name <repository_name> --location <path_to_repository>
```

where:

- `<repository_name>` — name of the repository.
- `<path_to_repository>` — path to the directory in which backup files will be stored.

For example:

```
$ veeamconfig repository create --name VeeamBackup --location /home/backups
```
Creating Repository in NFS Share

To create a repository in an NFS share, use the following command:

```
veeamconfig repository create --name <repository_name> --type nfs --location <path_to_repository>
--options <mounting_options>
```

where:

- `<repository_name>` — name of the backup repository.
- `<path_to_repository>` — path to the network shared folder where backup files will be stored in the `SERVER:/DIRECTORY` format.
- `<mounting_options>` — additional options that Veeam Agent will use to mount the network shared folder to the Veeam Agent machine file system. You can use the standard Linux `mount` command content as mounting options. This parameter is optional.

For example:

```
$ veeamconfig repository create --name VeeamBackup --type nfs --location srv01:/VeeamRepository --options vers=3,hard,retry=1
```

**TIP:**
If you mount a network shared folder to a directory in the Veeam Agent machine file system in advance, you can create the backup repository in the same way as in a local directory. For details, see Creating Repository in Local Directory.

Creating Repository in SMB Share

To create a repository in an SMB share, use the following command:

```
veeamconfig repository create --name <repository_name> --type smb --location <path_to_repository>
--username <user_name> --password <password> --domain <domain> --options <mounting_options>
```

where:

- `<repository_name>` — name for the backup repository.
- `<path_to_repository>` — path to the network shared folder where backup files will be stored in the `//SERVER/DIRECTORY` format.
- `<user_name>` — account name that Veeam Agent will use to access the SMB network shared folder.
- `<password>` — password that Veeam Agent will use to access the SMB network shared folder. This parameter is optional. If you do not use this option, you will be prompted to type a password of the specified account.
- `<domain>` — domain in which the account that has access permissions on the shared folder is registered.
• `<mounting_options>` — options that Veeam Agent will use to mount the network shared folder to the Veeam Agent machine file system. You can use the standard Linux `mount` command content as mounting options. This parameter is optional.

You can specify account name, password and domain for the SMB network shared folder using `--username`, `--password` and `--domain` parameters or `--options` parameter. Mind that if you specify account name, password and domain as values of the `--options` parameter, these values will override values of `--username`, `--password` and `--domain` parameters.

**Examples**

Command with `--username`, `--password`, `--domain` parameters:

```
$ veeamconfig repository create --name VeeamBackup --type smb --location //srv0 2/VeeamRepository --username Administrator --password P@ssw0rd --domain srv02
```

Command with `--options` parameter:

```
$ veeamconfig repository create --name VeeamBackup --type smb --location //srv0 2/VeeamRepository --options username=Administrator,password=P@ssw0rd,domain=srv02,port=666
```

**TIP:**

If you mount a network shared folder to a directory in the Veeam Agent machine file system in advance, you can create the backup repository in the same way as in a local directory. For details, see Creating Repository in Local Directory.
Viewing List of Backup Repositories

To view backup repositories configured in Veeam Agent for Linux, use the following command:

```
veeamconfig repository list
```

Veeam Agent will display a list of backup repositories.

You can view the following information about backup repositories:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the backup repository.</td>
</tr>
<tr>
<td>ID</td>
<td>ID of the backup repository.</td>
</tr>
<tr>
<td>Location</td>
<td>Directory in the local file system specified as a target location for backup files.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of the backup repository. Possible values:</td>
</tr>
<tr>
<td></td>
<td>• Local</td>
</tr>
<tr>
<td></td>
<td>• Backup server</td>
</tr>
<tr>
<td>Backup server</td>
<td>Backup server on which Veeam backup repository added to Veeam Agent is configured.</td>
</tr>
</tbody>
</table>

For example:

```
user@srv01:~$ veeamconfig repository list
Name         ID                                      Location        Type   Backup server
BackupVol01  {818e3a0f-8155-4a51-9430-248a203a43d1} /home/backups  local
BackupVol02  {2155a2e7-a1e9-4347-9d8b-cf8f3a6f3fcb}  /home/backups2 local
```
Editing Backup Repository

You can edit settings for a backup repository created with Veeam Agent for Linux.

You can edit the following parameters for the backup repository:

- Name of the backup repository
- Location of the backup repository

**NOTE:**

Consider the following:

- If you change location for the backup repository that is already used by a backup job and contains backup files, during the next backup job run, Veeam Agent will create a new backup chain in the new repository location.
- You can temporarily change backup repository location if you want to create an ad hoc full backup in addition to the backup chain created by the backup job in the original repository location.

Changing Backup Repository Name

To change a name for the backup repository, use the following command:

```
veeamconfig repository edit --name <new_name> for --name <old_name>
```

or

```
veeamconfig repository edit --name <new_name> for --id <id>
```

where:

- `<old_name>` — current name of the backup repository.
- `<new_name>` — desired name for the backup repository.
- `<id>` — ID of the backup repository.

For example:

```
user@srv01:~$ veeamconfig repository edit --name LocalRepository for --name Repository_1
```

Changing Backup Repository Location

To change location for the backup repository, use the following command:

```
veeamconfig repository edit --location <path> for --name <name>
```
or

```
veeamconfig repository edit --location <path> for --id <id>
```

where:
- `<path>` — desired path for the backup repository.
- `<name>` — current name of the backup repository.
- `<id>` — ID of the backup repository.

For example:

```
user@srv01:~$ veeamconfig repository edit --location /home/veeam for --id 3458797-3ffe-45bc-870e-c5628643bbb3
```

**Changing Backup Repository Name and Location**

You can change a name and location for the backup repository at the same time, for example:

```
user@srv01:~$ veeamconfig repository edit --name LocalRepository --location /home/veeam for --name Repository_1
```
Rescanning Veeam Backup Repository

If Veeam Agent for Linux fails to display backups stored in the Veeam Backup & Replication backup repository for some reason, you can rescan the Veeam backup repository. Veeam Agent will try to reconnect to the Veeam backup server and refresh the list of backups in the backup repository.

To rescan a Veeam backup repository, use the following command:

```bash
veeamconfig repository rescan --id <repository_id>
```

or

```bash
veeamconfig repository rescan --name <repository_name>
```

where:

- `<repository_id>` — ID of the backup repository that you want to rescan.
- `<repository_name>` — name of the backup repository that you want to rescan.

For example:

```bash
user@srv01:~$ veeamconfig repository rescan --name [vbr01]BackupVol01
```

You can also rescan all Veeam backup repositories managed by the backup server to which Veeam Agent is connected with the following command:

```bash
veeamconfig repository rescan --all
```
Deleting Backup Repository

You can delete a backup repository configured with Veeam Agent for Linux. When you delete a backup repository, Veeam Agent removes record of the deleted repository from its database. Backup files created by a backup job targeted at the deleted backup repository remain intact on the backup storage.

To delete a backup repository, use the following command:

```
veeamconfig repository delete --id <repository_id>
```

or

```
veeamconfig repository delete --name <repository_name>
```

where:

- `<repository_id>` — ID of the backup repository that you want to delete.
- `<repository_name>` — name of the backup repository that you want to delete.

For example:

```
user@srv01:~$ veeamconfig repository delete --name Repository_1
```

**NOTE:**
You cannot delete a backup repository that is specified as a backup storage location in the backup job settings.
Managing Veeam Backup & Replication Servers

You can store backup files created with Veeam Agent for Linux on backup repositories managed by Veeam Backup & Replication. To do this, you must connect to a Veeam backup server. After that, you can specify a Veeam backup repository as a target location for backup files in the properties of the backup job.
Connecting to Veeam Backup Server

To create Veeam Agent backups on a backup repository managed by Veeam Backup & Replication, you must connect to a Veeam backup server.

**IMPORTANT!**

Currently, Veeam Agent for Linux can be connected to one Veeam Backup & Replication server only. If you want to create backups on the backup repository managed by another Veeam backup server, you need to delete currently used backup server and all jobs targeted at backup repositories managed by this backup server. To learn more, see Deleting Connection to Veeam Backup Server.

If you add a connection to another backup server, backup jobs targeted at the original backup server will fail, and backups created on the Veeam backup repository will become unavailable in Veeam Agent. To continue using the original backup server, you need to delete the connection to the new backup server and re-create all backup jobs that use the original backup server.

If you change an account to connect to the Veeam backup server and then start a backup job targeted at the backup repository managed by this backup server, Veeam Agent will start a new backup chain on the backup repository.

To connect Veeam Agent for Linux to a Veeam backup server, use the following command:

```
veeamconfig vbrserver add --name <vbr_name> --address <vbr_address> --port <vbr_port> --login <username> --domain <domain> --password <password>
```

where:

- `<vbr_name>` — name of the Veeam backup server that manages the backup repository.
- `<vbr_address>` — DNS name or IP address of the Veeam backup server.

**IMPORTANT!**

If you specify a DNS name of the Veeam backup server, make sure that the Veeam backup server name is resolved into IPv4 address on the machine where Veeam Agent is installed. The Veeam Backup Service in Veeam Backup & Replication listens on IPv4 addresses only. If the Veeam backup server name is resolved into IPv6 address, Veeam Agent will fail to connect to the Veeam backup server.

- `<vbr_port>` — port over which Veeam Agent must communicate with Veeam Backup & Replication. The default port used for communication with the Veeam backup server is 10006.
- `<username>` — a name of the account that has access to the Veeam backup repository.
- `<domain>` — a name of the domain in which the account that has access to the Veeam backup repository is registered.
- `<password>` — password of the account that has access to the Veeam backup repository.

Permissions on the backup repository managed by the target Veeam backup server must be granted beforehand. To learn more, see Setting Up User Permissions on Backup Repositories.
For example:

```
user@srv01:-$ veeamconfig vbrserver add --name vbr01 --address 172.17.53.1 --port 10006 --login veeam --domain tech --password P@ssw0rd
```

When Veeam Agent for Linux connects to a Veeam Backup & Replication server, Veeam Agent retrieves information about backup repositories managed by this Veeam backup server and displays them in the list of available backup repositories. You can then specify a Veeam backup repository as a target for a backup job.

**TIP:**

To view the list of backup repositories, use the `veeamconfig repository list` command. To learn more, see [Viewing List of Backup Repositories](#).
Viewing List of Veeam Backup Servers

To view a list of Veeam backup servers to which Veeam Agent for Linux is connected, use the following command:

```
veeamconfig vbrserver list
```

Veeam Agent will display the list of Veeam backup servers.

For the Veeam backup server in the list, Veeam Agent for Linux displays the following information:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the Veeam backup server.</td>
</tr>
<tr>
<td>ID</td>
<td>ID of the Veeam backup server in the Veeam Agent database.</td>
</tr>
<tr>
<td>Endpoint</td>
<td>IP address of the Veeam backup server and port over which Veeam Agent for Linux communicates with Veeam Backup &amp; Replication.</td>
</tr>
</tbody>
</table>

For example:

```
user@srv01:$ veeamconfig vbrserver list
Name     ID                                      Endpoint
vbr01    {0fc87c11-6a8d-48c1-8aeb-7f7655738796} 172.17.53.1:10006
```
Viewing Backup Server Details

You can view detailed information about the Veeam backup server to which Veeam Agent for Linux is connected. Use the following command:

```bash
veeamconfig vbrserver info --name <vbr_name>
```

or

```bash
veeamconfig vbrserver info --id <vbr_id>
```

where:

- `<vbr_name>` — name of the Veeam backup server.
- `<vbr_id>` — ID of the Veeam backup server in the Veeam Agent database.

Veeam Agent for Linux displays the following information about the Veeam backup server:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>ID of the Veeam backup server in the Veeam Agent database.</td>
</tr>
<tr>
<td>Name</td>
<td>Display name of the Veeam backup server.</td>
</tr>
<tr>
<td>Endpoint</td>
<td>IP address of the Veeam backup server and port over which Veeam Agent for Linux communicates with Veeam Backup &amp; Replication.</td>
</tr>
<tr>
<td>Login</td>
<td>Name of the account that has access to the Veeam backup repository.</td>
</tr>
<tr>
<td>Domain</td>
<td>Name of the domain in which the account that has access to the Veeam backup repository is registered.</td>
</tr>
</tbody>
</table>

For example:

```
user@srv01:~$ veeamconfig vbrserver info --name vbr01
VBR server
  ID: {0fc87c11-6a8d-48c1-8aeb-7f7655738796}
  Name: vbr01
  Endpoint: 172.17.53.1:10006
  Login: veeam
  Domain: tech
```
Editing Connection to Veeam Backup Server

You can edit the following parameters for a connection to a Veeam backup server:

- Display name of the Veeam backup server
- IP address and port used to connect to the Veeam backup server
- Account to connect to the Veeam backup server

Changing Veeam Backup Server Name

To change a name for the Veeam backup server, use the following command:

```
veeamconfig vbrserver edit --name <new_vbr_name>
```

where:

- `<new_vbr_name>` — desired name for the backup server.

For example:

```
user@srv01:~$ veeamconfig vbrserver edit --name vbr01
```

Changing IP Address and Port for Veeam Backup Server

To change the IP address and port used to connect to the Veeam backup server, use the following command:

```
veeamconfig vbrserver edit --address <vbr_address> --port <vbr_port>
```

where:

- `<vbr_address>` — DNS name or IP address of the Veeam backup server.

**IMPORTANT!**

If you specify a DNS name of the Veeam backup server, make sure that the Veeam backup server name is resolved into IPv4 address on the machine where Veeam Agent is installed. The Veeam Backup Service in Veeam Backup & Replication listens on IPv4 addresses only. If the Veeam backup server name is resolved into IPv6 address, Veeam Agent will fail to connect to the Veeam backup server.

- `<vbr_port>` — port over which Veeam Agent for Linux must communicate with Veeam Backup & Replication.

For example:

```
user@srv01:~$ veeamconfig vbrserver edit --address 172.17.53.1 --port 10006
```
Changing Account to Connect to Veeam Backup Server

**NOTE:**

If you change an account to connect to the Veeam backup server and then start a backup job targeted at the backup repository managed by this backup server, Veeam Agent will start a new backup chain on the backup repository.

To change an account whose credentials will be used to connect to the Veeam backup server, use the following command:

```
veeamconfig vbrserver edit --login <username> --domain <domain> --password <password>
```

where:
- `<username>` — name of the account that has access to the Veeam backup repository.
- `<domain>` — name of the domain in which the account that has access to the Veeam backup repository is registered.
- `<password>` — password of the account that has access to the Veeam backup repository.

For example:

```
user@srv01:~$ veeamconfig vbrserver edit --login veeam --domain tech --password P@ssw0rd2
```

Changing Several Backup Server Parameters

You can change several parameters for the connection to the Veeam backup server simultaneously. For example, the following command changes the name and connection settings for the Veeam backup server:

```
user@srv01:~$ veeamconfig vbrserver edit --name vbr02 --address 172.17.53.2 --port 10006
```
Updating List of Veeam Backup Repositories

When you connect to a Veeam backup server, Veeam Agent for Linux retrieves information about backup repositories managed by this Veeam backup server and displays them in the list of available backup repositories. You can refresh information about available Veeam backup repositories manually at any time. This may be useful, for example, after a new backup repository was added on the Veeam backup server.

To update the list of backup repositories managed by the Veeam backup server, use the following command:

```
veeamconfig vbrserver resync
```

**TIP:**

To view updated list of available Veeam backup repositories after resync, use the `veeamconfig repository list` command. To learn more, see Viewing List of Backup Repositories.
Deleting Connection to Veeam Backup Server

You can delete a connection to the Veeam backup server to which Veeam Agent is currently connected. When you delete a connection to a Veeam backup server, Veeam Agent removes record on the deleted backup server from its database. Veeam backup repositories managed by the deleted backup server are removed from the list of available backup repositories. Backup files created by backup jobs targeted these repositories remain intact on the backup storage.

You cannot delete a connection to a Veeam backup server if a backup repository managed by this backup server is used by a backup job. To remove such connection to a Veeam backup server, you first need to delete a reference to the Veeam backup repository in the job settings.

To delete a connection to the Veeam backup server, use the following command:

```bash
veeamconfig vbrserver delete --name <vbr_name>
```

or

```bash
veeamconfig vbrserver delete --id <vbr_id>
```

where:

- `<vbr_name>` — name of the Veeam backup server.
- `<vbr_id>` — ID of the Veeam backup server.

For example:

```bash
user@srv01:~$ veeamconfig vbrserver delete --name vbr01
```
Managing Service Providers

You can store backup files created with Veeam Agent for Linux on a cloud repository exposed to you by a Veeam Cloud Connect service provider. To do this, you must connect to a service provider. After that, you can specify a cloud repository as a target location for backup files in the properties of the backup job.
Connecting to Service Provider

To create Veeam Agent backups on a cloud repository, you must connect to a Veeam Cloud Connect service provider.

To connect Veeam Agent for Linux to a service provider, use the following command:

```
veeamconfig cloud add --name <sp_name> --address <sp_address> --port <sp_port> --login <username> --password <password> --fingerprint <sp_thumbprint>
```

where:

- `<sp_name>` — name of the service provider to which you want to connect.
- `<sp_address>` — IP address or full DNS name of the cloud gateway that the SP or your backup administrator has provided to you.
- `<sp_port>` — port over which Veeam Agent must communicate with the cloud gateway. The default port used for communication with the cloud gateway is 6180.
- `<username>` — name of the tenant or subtenant account that the SP or your backup administrator has provided to you. The name of the subtenant account must be specified in the `TENANT/SUBTENANT` format.
- `<password>` — password of the tenant or subtenant account used to connect to the service provider.
- `<sp_thumbprint>` — thumbprint used to verify the TLS certificate that the SP has provided to you.

For example:

```
user@srv01:~$ veeamconfig cloud add --name SP --address 172.17.53.15 --port 6180 --login TechCompany/User01 --password P@ssw0rd --fingerprint 92FA988A3D9E80EE095DDAB75BF06B05DF6F205B
```

**NOTE:**

When you enter the `veeamconfig cloud add` command, Veeam Agent will display information about the TLS certificate obtained from the SP. To accept the certificate, type `yes` in the command prompt and press Enter.

When Veeam Agent connects to the service provider, Veeam Agent retrieves information about cloud repositories available to the tenant or subtenant and displays them in the list of available backup repositories. You can then specify a cloud repository as a target for a backup job.

**TIP:**

To view the list of available cloud repositories, use the `veeamconfig repository list` command. To learn more, see Viewing List of Backup Repositories.
Viewing List of Service Providers

To view a list of service providers to which Veeam Agent is connected, use the following command:

```
veeamconfig cloud list
```

Veeam Agent will display the list service providers.

For the service provider in the list, Veeam Agent for Linux displays the following information:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the service provider.</td>
</tr>
<tr>
<td>ID</td>
<td>ID of the service provider in the Veeam Agent database.</td>
</tr>
<tr>
<td>Address</td>
<td>IP address of the cloud gateway and port over which Veeam Agent communicates with the cloud gateway.</td>
</tr>
<tr>
<td>Gate servers</td>
<td>IP address of the cloud gateway and port over which Veeam Agent communicates with the cloud gateway.</td>
</tr>
<tr>
<td>Username</td>
<td>Name of the tenant or subtenant account used for connection to the service provider.</td>
</tr>
</tbody>
</table>

For example:

```
user@srv01:$ veeamconfig cloud list
Name        ID                                      Address                Gate
servers  Username
SP          {0840f770-354d-426a-b5ce-1aa80f56cc08}  172.17.53.15:6180   TechCompany
```
Editing Connection to Service Provider

You can edit the following parameters for a connection to a Veeam Cloud Connect service provider:

- Display name of the Veeam Cloud Connect service provider
- IP address and port used to connect to the cloud gateway
- Account to connect to the service provider
- Thumbprint to connect to the service provider

Changing SP Name

To change a name for the SP, use the following command:

```
veeamconfig cloud edit --name <new_sp_name> for --name <old_sp_name>
```

or

```
veeamconfig cloud edit --name <new_sp_name> for --id <sp_id>
```

where:

- `<old_sp_name>` — current name of the SP.
- `<new_sp_name>` — desired name for the SP.
- `<sp_id>` — ID of the SP.

For example:

```
user@srv01:~$ veeamconfig cloud edit --name SP for --id 7d3022de-4f4d-4c70-85eb-e8a946a555cd
```

Changing IP Address and Port for Cloud Gateway

To change the IP address and port of the cloud gateway provided by the SP, use the following command:

```
veeamconfig cloud edit --address <sp_address> --port <sp_port> for --name <sp_name>
```

or

```
veeamconfig cloud edit --address <sp_address> --port <sp_port> for --id <sp_id>
```
where:

- `<sp_address>` — IP address or full DNS name of the cloud gateway that the SP or your backup administrator has provided to you.
- `<sp_port>` — port over which Veeam Agent must communicate with the cloud gateway. The default port used for communication with the cloud gateway is 6180.
- `<sp_name>` — name of the SP.
- `<sp_id>` — ID of the SP.

For example:

```
user@srv01:$ veeamconfig cloud edit --address 172.17.53.67 --port 6180 for --name SP
```

### Changing Account to Connect to SP

To change an account whose credentials will be used to connect to the SP, use the following command:

```
veeamconfig cloud edit --login <username> --password <password> for --name <sp_name>
```

or

```
veeamconfig cloud edit --login <username> --password <password> for --id <sp_id>
```

where:

- `<username>` — name of the tenant or subtenant account that the SP or your backup administrator has provided to you. The name of the subtenant account must be specified in the `TENANT/SUBTENANT` format.
- `<password>` — password of the tenant or subtenant account used to connect to the service provider.
- `<sp_name>` — name of the SP.
- `<sp_id>` — ID of the SP.

For example:

```
user@srv01:$ veeamconfig cloud edit --login ABC_Compan/User01 --password P@ssw0rd for --name SP
```
Changing Thumbprint to Connect to SP

To change a thumbprint that will be used to connect to the SP, use the following command:

```
veeamconfig cloud edit --fingerprint <sp_thumbprint> for --name <sp_name>
```

or

```
veeamconfig cloud edit --fingerprint <sp_thumbprint> for --id <sp_id>
```

where:

- `<sp_thumbprint>` — thumbprint used to verify the TLS certificate and connect to the service provider.
- `<sp_name>` — name of the SP.
- `<sp_id>` — ID of the SP.

For example:

```
user@srv01:~$ veeamconfig cloud edit --fingerprint 92FA988A3D9E80EE095DDAB75BF06B05DF6F205B for --name SP
```
### Updating List of Cloud Repositories

When you connect to the Veeam Cloud Connect service provider, Veeam Agent for Linux retrieves and saves to the database information about cloud repositories available to the tenant or subtenant whose account you use to connect to the SP. You can refresh information about available cloud repositories manually at any time. This may be useful, for example, after the SP changes backup resource settings for the tenant.

To update the list of cloud repositories, use the following command:

```
veeamconfig cloud resync
```

If the cloud repository currently used as a target location for Veeam Agent backups becomes unavailable, and Veeam Agent fails to reflect this change in its database for some reason, the `veeamconfig cloud resync` command may finish with errors. In this case, you can use the `--force` option to refresh information about available cloud repositories. For example:

```
veeamconfig cloud resync --force
```

With the `--force` option, Veeam Agent will retrieve the list of available cloud repositories from the service provider and save the new information about cloud repositories in the Veeam Agent database.

**TIP:**

To view updated list of available cloud repositories after resync, use the `veeamconfig cloud list` command. To learn more, see Viewing List of Service Providers.
Deleting Connection to Service Provider

You can delete a connection to the service provider to which Veeam Agent for Linux is currently connected. When you delete a connection to a service provider, Veeam Agent removes the record on the deleted service provider from the database. Cloud repositories managed by the deleted service provider are removed from the list of available backup repositories. Backup files created by backup jobs targeted at these repositories remain intact on the cloud repository.

You cannot delete a connection to the service provider if a cloud repository managed by this service provider is used by a backup job. To remove such connection to a service provider, you first need to delete a reference to the cloud repository in the job settings.

To delete a connection to the service provider, use the following command:

```
veeamconfig cloud delete --name <sp_name>
```

or

```
veeamconfig cloud delete --id <sp_id>
```

where:

- `<sp_name>` — name of the service provider.
- `<sp_id>` — ID of the service provider.

For example:

```
user@srv01:~$ veeamconfig cloud delete --name SP
```
Managing Backups

You can perform the following operations with backups created by backup jobs configured in Veeam Agent for Linux:

- View backups
- View backup details
- View restore points in backup
- Export backup to a virtual disk
- Import backup to the Veeam Agent database
- Delete backup
Viewing Backups

To view a list of backups created by Veeam Agent, use the following command:

```
veeamconfig backup list --all
```

In the list of backups, Veeam Agent displays information about all Veeam Agent for Linux backups stored in all backup repositories. If Veeam Agent is connected to a Veeam backup server, all Veeam Agent for Linux backups that are kept on Veeam backup repositories managed by this server also appear in this list.

The `--all` parameter is optional. If you do not use this option, Veeam Agent displays information about backups created by the current Veeam Agent computer only.

For each backup, Veeam Agent displays the following information:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job name</td>
<td>Host name of the computer on which the backup job was configured and name of the job by which the backup was created.</td>
</tr>
<tr>
<td>Backup ID</td>
<td>ID of the backup.</td>
</tr>
<tr>
<td>Repository</td>
<td>Name of the backup repository in which the backup was created. Imported backups are marked as <em>Imported</em> in the <em>Repository</em> column. For information about the import procedure, see Importing Backups.</td>
</tr>
<tr>
<td>Created at</td>
<td>Date and time of the backup creation.</td>
</tr>
</tbody>
</table>

For example:

```
user@srv01:~$ veeamconfig backup list --all
Job name          | Backup ID                                      | Repository|
------------------|-----------------------------------------------|-----------|
srv01 SystemBackup| {45f074d2-d2d9-423d-84e9-8f1798b08d4c}        | Repository_|
1 2016-11-11 17:37| {ea64a7e5-038a-4c86-970a-6d59d4cf3968}        | Repository_|
srv01 DocumentsBackup| {4f75bb20-a6b6-4323-9287-1c6c8cecccb6b}        | Repository_|
1 2016-11-11 18:30| {951ac571-dd29-45ac-8624-79b8ccb45863}        | Repository_|
wrk01 SystemBackup| {8d6d4d39-51b2-48b1-ac7a-84f2d6dbc167}        | Repository_|
2 2016-11-13 15:26| {8d6d4d39-51b2-48b1-ac7a-84f2d6dbc167}        | Repository_|
wrk02 SystemBackup| {8d6d4d39-51b2-48b1-ac7a-84f2d6dbc167}        | Repository_|
3 2016-11-13 15:59| {8d6d4d39-51b2-48b1-ac7a-84f2d6dbc167}        | Repository_|
```

**TIP:**

If you want to recover data from a backup that is stored in another location, for example, a backup created with another instance of Veeam Agent, you can import such backup into the Veeam Agent database on your computer. To learn more, see Importing Backups.
Viewing Backup Details

You can view detailed information about specific backup. To view backup details, use the following command:

```
veeamconfig backup show --id <backup_id>
```

where:

- `<backup_id>` — ID of the backup for which you want to view detailed information.

For a volume-level backup, Veeam Agent for Linux displays the following information:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Machine name</td>
<td>Host name of the machine on which the backup job is configured and the name of the job.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the volume in the backup.</td>
</tr>
<tr>
<td>Device</td>
<td>Path to the block device file that represents the volume.</td>
</tr>
<tr>
<td>FS UUID</td>
<td>File system ID.</td>
</tr>
<tr>
<td>Offset</td>
<td>Position of the volume on the computer disk.</td>
</tr>
<tr>
<td>Size</td>
<td>Size of the volume in the backup.</td>
</tr>
</tbody>
</table>

For example:

```
user@srv01:$ veeamconfig backup show --id 4f75bb20-a6b6-4323-9287-1c6c8ceccb6b
Machine name: srv01 SystemBackup
    Name: [sda1]
    Device: [/dev/sda1]
    FS UUID: [6945f2eb-e8bb-49fe-a276-5ba67b9030a5]
    Offset: [1048576] bytes (2048 sectors)
    Size: [9999220736] bytes (19529728 sectors)
```

For a file-level backup, Veeam Agent for Linux displays the following information:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Machine name</td>
<td>Host name of the machine on which the backup job is configured and the name of the job.</td>
</tr>
<tr>
<td>Backed up</td>
<td>Backup scope for the file-level backup job.</td>
</tr>
</tbody>
</table>
For example:

```
user@srv01:~$ veeamconfig backup show --id ea64a7e5-038a-4c86-970a-6d59d4cf3968
    Machine name: srv01 DocsBackup
    File-level backup
    Backed up:
        /home/user/Documents
```
Viewing Restore Points in Backup

To view information about restore points in the backup, you can use one of the following commands:

```
veeamconfig backup info --id <backup_id>
```

or

```
veeamconfig point list --backupid <backup_id>
```

where:

`<backup_id>` — ID of the backup for which you want to view information on restore points.

For example:

```
user@srv01:~$ veeamconfig backup info --id 4f75bb20-a6b6-4323-9287-1c6c8ceccb6b
```

or

```
user@srv01:~$ veeamconfig point list --backupid 4f75bb20-a6b6-4323-9287-1c6c8ceccb6b
```

Veeam Agent for Linux displays the following information about restore points in the backup:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Job name</strong></td>
<td>Name of the backup job by which the backup was created.</td>
</tr>
<tr>
<td><strong>OIB ID</strong></td>
<td>ID of the restore point in the backup.</td>
</tr>
</tbody>
</table>
| **Type** | Type of the restore point. Possible values:  
- Full  
- Increment |
| **Created at** | Date and time of the restore point creation. |
| **Is corrupt** | Indicates whether restore point in the backup is corrupted. Possible values:  
- True  
- False |
Importing Backups

You can import a backup created by Veeam Agent into the Veeam Agent database. For example, you may want to import a previously deleted backup or backup that was created in a network shared folder by Veeam Agent installed on another computer.

To import a backup:

1. Start the import process with the following command:

   
   ```
   veeamconfig backup import --path <path>
   ```

   where:

   `<path>` — path to the VBM file of the backup that you want to import.

   For example:

   ```
   user@srv01:~$ veeamconfig backup import --path /home/share/BackupJob/BackupJob.vbm
   ```

   Backup has been imported successfully.
   Session ID: [4031f058-766c-4f2c-a7ae-7257adb2929f].
   Logs stored in: [/var/log/veeam/Import/Session_{4031f058-766c-4f2c-a7ae-7257adb2929f}].

2. You can monitor the import process and result by viewing the import session log with the following command:

   ```
   veeamconfig session log --id <session_id>
   ```

   where:

   `<session_id>` — ID of the import session.

   For example:

   ```
   user@srv01:~$ veeamconfig session log --id 4031f058-766c-4f2c-a7ae-7257adb2929f
   ```

   2016-11-19 13:21:33 UTC {6ae2922d-454b-4a8d-a11b-2b5c7a85029d} [info] Importing backup
   2016-11-19 13:21:33 UTC {783f40a7-ead7-4555-9c35-545d875990ee} [info] Backup has been imported.

3. Imported backup will be displayed in the list of backups. To view the list of backups, use the following command:

   ```
   veeamconfig backup list
   ```
For example:

```bash
user@srv01:~$ veeamconfig backup list
Job name            Backup ID                               Repository
y    Created at
srv01 SystemBackup  {45f074d2-d2d9-423d-84e9-8f1798b08d4c}  Repository_1  2016-11-11 17:37
srv01 DocsBackup    {ea64a7e5-038a-4c86-970a-6d59d4cf3968}  Repository_1  2016-11-11 18:30
srv01 HomeBackup    {4f75bb20-a6b6-4323-9287-1c6c8cecccb6b}  Repository_2  2016-11-15 11:28
BackupJob           {64957b1d-d219-456c-a9cd-9598292c10cd}  Importe
```

### Importing Encrypted Backups

You can import an encrypted backup created by Veeam Agent into the Veeam Agent database. This operation is required if you want to use the Veeam Agent command line interface to restore data from an encrypted backup created by Veeam Agent running on another computer.

To import an encrypted backup:

1. Start the import process with the following command:

   ```bash
   veeamconfig backup import --path <path>
   ```

   where:

   `<path>` — path to the VBM file of the backup that you want to import.

   For example:

   ```bash
   user@srv01:~$ veeamconfig backup import --path /home/share/srv15\ Backup/Backup.vbm
   ```

2. Veeam Agent will prompt you to provide a password for the backup file. Type in the password and press the Enter key to import the backup.

   Veeam Agent displays a hint for the password that was used to encrypt the backup file. Use the hint to recall the password.

   If you enter the correct password, Veeam Agent will decrypt the backup file and import it into the database.

   ```bash
   user@srv01:~$ veeamconfig backup import --path /home/share/srv15\ Backup/Backup.vbm
   [Info] Backup srv15 Backup encrypted
   [Info] Press "Enter" to skip. Enter password to decrypt the backup:
   [Info] Hint: Standard password
   Password: 
   Backup imported successfully
   ```
3. Imported backup will be displayed in the list of backups. To view the list of backups, use the following command:

```bash
veeamconfig backup list
```

For example:

```
user@srv01:~$ veeamconfig backup list
Job name          Backup ID                               Repositor
y                Created at
srv15 Backup     {4b1f873c-857d-b984-4f22-6ce66bf62570}  Imported
                  2018-06-12 20:20
srv01 ServerBackup  {f212f641-54aa-40de-a0eb-8727be56760b}  Imported
                  2018-06-12 20:04
```
Deleting Backups

Backup files created with Veeam Agent are removed automatically according to the retention policy settings. You can also remove backups from the target location and/or Veeam Agent configuration database manually if necessary.

Removing Backup from Configuration

To remove a backup from the Veeam Agent configuration database, use the following command:

```
veeamconfig backup delete --id <backup_id>
```

where:

`<backup_id>` — ID of the backup that you want to delete.

Veeam Agent for Linux will remove records about the deleted backup from the Veeam Agent database. Backup files themselves (VBK, VIB, VBM) remain in the backup repository. You can import the removed backup later to Veeam Agent for Linux and perform restore operations with the imported backup.

Deleting Backup Files

To delete backup files from the target location and Veeam Agent database, use the following command:

```
veeamconfig backup delete --id <backup_id> --purge
```

where:

`<backup_id>` — ID of the backup that you want to delete.

Veeam Agent for Linux will remove records about the deleted backup from the Veeam Agent database and, additionally, delete backup files themselves from the destination storage.
Performing Restore

If you experience a problem with your computer, your data gets lost or corrupted, you can use one of the following options to recover your data or bring the computer back to work:

- Restore from the Veeam Recovery Media
  - Restore volumes
  - Restore files and folders
- Restore volumes with the command line interface
- Restore files and folders:
  - Restore files and folders with the File Level Restore wizard
  - Restore files and folders with the command line interface
- Export data as VHD disks
- Restore data from encrypted backups
Restoring from Veeam Recovery Media

If the OS on your computer fails to start, you can use the Veeam Recovery Media to recover your computer. The Veeam Recovery Media will help you boot the computer in the limited mode. After booting, you can use a backup created with Veeam Agent for Linux to restore the whole system image of your computer, specific volumes on your computer or specific files and folders. You can also use standard Linux command line utilities to diagnose problems and fix errors.

IMPORTANT!

If you plan to use the custom Veeam Recovery Media, Veeam Agent requires 3 GB RAM or more installed on the target computer or virtual machine. Memory consumption varies depending on size and number of modules included into the recovery media. To learn more, see Creating Custom Veeam Recovery Media.
Restoring Volumes

You can restore a specific computer volume or all volumes from the volume-level backup.

Volumes can be restored to their original location or to a new location.

- If you restore a volume to its original location, Veeam Agent will overwrite the data on the original volume with the data restored from the backup.
- If you restore volume data to a new location, Veeam Agent will restore data from the backup and write it to the selected destination. If necessary, you can specify new disk mapping settings for the restored volume.

Before You Begin

Before you boot from the recovery image and recover your data, check the following prerequisites and limitations:

- You must have a recovery image on any type of media: CD/DVD/BD or removable storage device.
- To recover data on your computer, you must have both the Veeam Recovery Media and data backup. For volume-level restore, you can use a volume-level backup created with Veeam Agent for Linux. Make sure that the backup or system image is available on the computer drive (local or external), on a network shared folder or on the backup repository managed by a Veeam backup server.
- The media type on which you have created the recovery image must be set as a primary boot source on your computer.
- The volume-level backup from which you plan to restore data must be successfully created at least once.
- [For backups stored in network shared folders, on Veeam backup repositories and Veeam Cloud Connect repositories] You must have access to the target location where the backup file resides.
- [For Veeam backup repository targets] If you plan to restore data from a backup stored on a Veeam backup repository, you must have access permissions on this backup repository. To learn more, see Setting Up User Permissions on Backup Repositories.
- You cannot restore a volume to the volume where the backup file that you use for restore is located.
- Veeam Recovery Media 3.0 and later versions do not support Oracle VM virtual machines. Use an earlier version of Veeam Recovery Media or contact Veeam Customer Support for workarounds.
Step 1. Boot from Veeam Recovery Media

To boot from the Veeam Recovery Media:

1. [For CD/DVD/BD] Power on your computer. Insert the media with the recovery image to the drive and power off the computer.
   [For removable storage device] Attach the removable storage device with the recovery image to your computer.

2. Start your computer.

3. Wait for Veeam Agent to load files from the Veeam Recovery Media.

4. After the recovery image OS has loaded, accept the terms of the product license agreement and license agreements for third-party components of the product:
   a. Make sure that the I accept Veeam End User Software License Agreement option is selected and press Space.
   b. Select the I accept the terms of the following 3rd party software components license agreements option with the Tab key and press Space.
   c. Switch to the Continue button with the Tab key and press Enter.

5. Make sure that network settings are specified correctly and configure the network adapter if necessary. To learn more, see Configure Network Settings.

6. Choose the necessary recovery option. Veeam Agent offers the following tools:
   - Restore volumes — the Veeam Recovery wizard to recover data on the original computer or perform bare-metal recovery.
   - Restore files — the File Level Restore wizard to restore files and folders to the original location or to a new location.
- **Switch to command line** — Linux shell prompt with standard utilities to diagnose problems and fix errors.

**TIP:**

To stop working with the Veeam Recovery Media and shut down or restart your computer, in the Veeam Recovery Media main menu, select the **Reboot** or **Shutdown** option and press **Enter**.
Step 2. Configure Network Settings

To open the **Network settings** dialog, in the Veeam Recovery Media main menu, select the **Configure network** option and press **Enter**.

Veeam Agent for Linux will display network adapters that are available on the system. If there is a DHCP server in your network, Veeam Agent will configure the network settings automatically and display the IP address assigned to the network adapter. You can then press **Esc** to return to the Veeam Recovery Media main menu and launch the Volume Restore wizard.

You can manually configure TCP/IP v4 settings for network adapters if necessary. To learn more, see **Specifying Network Settings**.

---

### Specifying Network Settings

You can manually configure TCP/IP v4 settings for the network adapter. To configure network settings:

1. In the **Choose adapter** list, select the network adapter that you want to use to connect to the network shared folder or Veeam backup repository where the backup resides and press **Enter**.

2. In the **Configure adapter** dialog, select the **Manual** option and press **Enter**.

3. In the **Adapter settings** dialog, specify the following network settings:
   
   - IP address
   - Subnet mask
   - Default gateway
   - DNS server

4. Select the **Apply** button and press **Enter**.
If there is a DHCP server in your network, you can return to automatic IP addressing:

1. In the **Choose adapter** list, select the necessary network adapter and press **Enter**.

2. In the **Configure adapter** dialog, select the **Auto** option and press **Enter**. Veeam Agent will automatically configure network settings for the adapter.
Step 3. Launch Volume Restore Wizard

To launch the volume restore wizard, in the Veeam Recovery Media main menu, select **Restore volumes** and press **Enter**.
Step 4. Select Backup Location

At the Select backup location step of the wizard, specify where the backup file that you want to use for data recovery is located.

To recover data from backup, you need to mount the backup storage on which the backup file resides to the recovery image OS file system. Veeam Agent for Linux automatically mounts external USB drives that are connected to the computer and displays them in the list of available backup locations. You can select the necessary device and press Enter to pass to the Browse for backup files step of the wizard.

If the backup file is located in a network shared folder, on a local drive or on a Veeam backup repository, select one of the following options:

- **Add shared folder** — select this option if the backup file is located in a network shared folder. With this option selected, you will pass to the Mount shared folder step of the wizard.

- **Mount local disk** — select this option if the backup file resides on the local computer drive, external drive or removable storage device that is currently connected to your computer. With this option selected, you will pass to the Select local disk step of the wizard.

- **Add VBR server** — select this option if the backup file resides on a backup repository managed by the Veeam backup server. With this option selected, you will pass to the Specify backup server parameters step of the wizard.

- **Add Cloud provider** — select this option if the backup file resides on a cloud repository exposed to you by a Veeam Cloud Connect service provider. With this option selected, you will pass to the Specify Cloud provider parameters step of the wizard.
Step 5. Specify Backup Location Settings

Specify settings for the target storage that contains a backup file from which you plan to restore data:

- **Specify shared folder settings** — if you have selected the **Add shared folder** option at the **Select backup location** step of the wizard.

- **Select local drive** — if you have selected the **Mount local disk** option at the **Select backup location** step of the wizard.

- **Specify Veeam backup repository settings** — if you have selected the **Add VBR server** option at the **Select backup location** step of the wizard.

- **Specify Veeam Cloud Connect repository settings** — if you have selected the **Add Cloud provider** option at the **Select backup location** step of the wizard.

Specifying Shared Folder Settings

The **Mount shared folder** step of the wizard is available if you have selected to restore data from a backup file located in a network shared folder.

Specify settings for the network shared folder:

1. Select the type of a network shared folder:
   - **NFS** — to connect to a network shared folder using the NFS protocol.
   - **SMB** — to connect to a network shared folder using the SMB (CIFS) protocol.

2. In the **Path** field, specify the network shared folder name in the `SERVER/DIRECTORY` format: type an IP address or domain name of the server and the name of the network shared folder in which the backup file resides.

3. [For SMB network shared folder] In the **Domain** field, type a name of the domain in which the account that has access permissions on the shared folder is registered, for example: `DOMAIN`.

4. [For SMB network shared folder] In the **Username** field, type a name of the account that has access permissions on the shared folder.

5. [For SMB network shared folder] In the **Password** field, type a password of the account that has access permissions on the shared folder.

6. Press **Enter** to connect to the network shared folder. Veeam Agent will mount the specified network shared folder to the `/media` directory of the recovery image OS file system and display content of the network shared folder.
TIP:
You can mount several network shared folders to work with backup files that are stored in different locations if needed. To do this, return to the Select Backup Location step of the wizard and select the Add shared folder option once again. For every mounted location, Veeam Agent displays its name, type and mount point. You can view the list of mounted network shared folders and browse for a backup file located on the necessary storage.

Selecting Local Drive
The Select local disk step of the wizard is available if you have selected to restore data from a backup file located on a computer drive.

In the list of devices, select the necessary disk or disk partition and press Enter. Veeam Agent will mount the selected device to the /media directory of the recovery image OS file system and display content of the directory.
TIP:
You can mount several devices to work with backup files that are stored in different locations if needed. To do this, return to the **Select Backup Location** step of the wizard and select the **Mount local disk** option once again. For every mounted location, Veeam Agent displays its name, type and mount point. You can view the list of mounted devices and browse for a backup file located on the necessary storage.

### Specifying Backup Server Settings

The **Specify Backup Server parameters** step of the wizard is available if you have selected to restore data from a backup repository managed by the Veeam backup server.

Specify settings for the Veeam backup server that manages the backup repository where the backup file resides:

1. In the **Address** field, specify a DNS name or IP address of the Veeam backup server.
2. In the **Port** field, specify a number of the port over which Veeam Agent must communicate with the backup repository. By default, Veeam Agent uses port 10006.
3. In the **Login** field, type a name of the account that has access to the Veeam backup repository.
4. In the **Domain** field, type a name of the domain in which the account that has access to the Veeam backup repository is registered, for example: `DOMAIN`.
5. In the **Password** field, type a password of the account that has access to the Veeam backup repository.
6. Press **Enter**. Veeam Agent will connect to the Veeam backup server, and you will pass immediately to the **Backup** step of the wizard.

**Specifying Service Provider Settings**

If you have selected to restore data from a backup file located on a Veeam Cloud Connect repository, specify settings to connect to the cloud repository:

1. **Specify service provider settings**.
2. **Verify the TLS certificate**.
3. **Specify user account settings**.

**Specifying Service Provider Settings**

The **Specify Cloud provider parameters** step of the wizard is available if you have selected to restore data from a cloud repository exposed to you by a Veeam Cloud Connect service provider.

Specify service provider settings that the SP or your backup administrator has provided to you:

1. In the **DNS name or IP address** field, enter a full DNS name or IP address of the cloud gateway.
2. In the **Port** field, specify the port over which Veeam Agent will communicate with the cloud gateway. By default, port 6180 is used.
3. Press **Enter**. Veeam Agent will connect to the service provider and display the Certificate details window.

Verifying TLS Certificate

In the **Certificate details** window, review information about the TLS certificate obtained from the SP side and verify the TLS certificate.

- To accept the TLS certificate, select the **Accept** button with the **Tab** key and press **Enter**.
- [Optional] To verify the TLS certificate with a thumbprint, do the following:
  - Select the **Verify thumbprint** button with the **Tab** key and press **Enter**.
  - In the **Thumbprint verification** field, enter the thumbprint that you obtained from the SP.
c. Switch to the **Verify** button and press **Enter**. Veeam Agent will check if the thumbprint that you entered matches the thumbprint of the obtained TLS certificate.

TLS certificate verification is optional. You can use this option to verify self-signed TLS certificates. TLS certificates signed by the CA do not require additional verification.

---

**Specifying User Account Settings**

The **Specify Cloud provider credentials** step of the wizard is available if you have chosen to restore data from a cloud repository and specified settings for the cloud gateway.

1. In the **Username** field, enter the name of the tenant or subtenant account that the SP or your backup administrator has provided to you. The name of the subtenant account must be specified in the **TENANT\SUBTENANT** format.

2. In the **Password** field, provide a password for the tenant or subtenant account.
3. **Press Enter.** Veeam Agent will connect to the cloud repository, and you will pass immediately to the Backup step of the wizard.
Step 6. Browse for Backup File

At the **Browse for backup files** step of the wizard, select the backup file that you plan to use for volume-level restore:

1. In the file system tree, select a directory in which the backup file you plan to use for restore resides:
   - Use **Up** and **Down** arrow keys to select a directory.
   - Use the **Enter** key to open the necessary directory.

2. In the directory where the backup file resides, select the backup file and press **Enter**.

![Image of Veeam Recovery Media](image-url)
Step 7. Select Backup and Restore Point

At the **Backup** step of the wizard, select a backup and restore point from which you want to recover data.

The **Backup** step window comprises two panes:

- The **Imported backups** pane on the left displays information about backup: host name of the computer whose data is stored in the backup file, backup job name and number of restore points.
- The **Restore points** pane on the right displays a list of restore points in the backup.

To select backup and restore point:

1. In the **Imported backups** pane, ensure that the backup from which you want to recover data is selected and press **Enter**.

   If you want to select another backup, press the ‘i’ key and browse for the necessary backup file. To learn more, see Locate Backup File.

   ![Veeam Recovery Media](image)

<tr>
<td>Show all...</td>
<td></td>
</tr>
</tbody>
</table>

2. In the **Restore points** pane, select with **Up** and **Down** keys the restore point from which you want to recover data and press **Enter**.
NOTE:

If you selected an encrypted backup for data restore, Veeam Agent will prompt you to provide a password to unlock the encrypted file. To lean more, see Restoring Data from Encrypted Backups.

Step 8. Map Restored Disks

At the **Disk Mapping** step of the wizard, select what volumes you want to restore and map volumes from the backup to volumes on your computer.

**IMPORTANT!**

It is strongly recommended that you change disk mapping settings only if you have experience in working with Linux disks and partitions. If you make a mistake, your computer data may get corrupted.

You can map volumes in the backup (source volumes) and volumes on your computer (target volumes) in one of the following ways:

- Map a source volume to a target volume
- Map a target volume to a source volume

As well as individual volumes, you can also map entire disks:

- Map a source disk to a target disk
- Map a target disk to a source disk

If you choose to restore an entire disk, Veeam Agent will try to map all volumes that reside on this disk.

If you want to restore Btrfs subvolumes, you must map subvolumes in the backup to a Btrfs pool on the Veeam Agent computer. To learn more, see Mapping Btrfs Subvolumes.

**Mapping Source Volume to Target Volume**

The **In backup** pane of the **Veeam Recovery Media** wizard contains a list of disks and volumes in the backup. You can select volumes in the backup that you want to restore to your computer and specify mapping rules for these volumes.
To map a source volume to a target volume:

1. In the **In backup** pane, select a volume in the backup whose data you want to recover and press **Enter**.

![Diagram showing CURRENT SYSTEM and IN BACKUP sections with device information and available operations]

2. Veeam Agent for Linux will display a window with information on the selected volume (partition type, file system type, mount point and volume size) and a list of available operations:
   - **Restore volume to** — select this option if you want to restore the selected volume to your computer.
   - **Close** — select this option if you want to close the window and select another volume.

3. Select the **Restore volume to** option and press **Enter**.

![Diagram showing the selected volume's details and available operations]

**CURRENT SYSTEM** | **IN BACKUP**
---|---
Device | Restore | Size | Device | Size | Usage
---|---|---|---|---|---
sda (boot) | | 60.00G | sda (boot) | | 60.00G
sda1 | | 18.60G | sda1 | | 18.60G / (ext4)
sda2 | | 38.31G | sda2 | | 38.31G /home (ext4)
sda3 | | 3.06G | sda3 | | 3.06G (swap)
sdb (boot) | | 10.00G | sdb (boot) | | 10.00G
sdb1 (lun) | | 10.00G | sdb1 (lun) | | 10.00G /CLUM2_mem...
u | | 10.00G | u | | 10.00G
lu1 | | 5.00G | lu1 | | 5.00G
lu2 | | 5.00G | lu2 | | 5.00G
4. Veeam Agent for Linux will display a list of volumes on your computer. Select the volume that you want to restore and press **Enter**.

5. In the **Current system** pane, in the **Restore** column, Veeam Agent will display which volume from backup will be restored to the target volume.

6. Repeat steps 1–5 for all volumes that you want to restore.

7. Press 's' to start the restore process.
Mapping Target Volume to Source Volume

The **Current system** pane of the Veeam Recovery Media wizard displays a partition table of your computer booted from the Veeam Recovery Media. In this pane, you can select volumes on your computer which you want to restore and specify mapping rules for these volumes. If necessary, you can edit the disk layout before restoring volumes.

To map a target volume to a source volume:

1. In the **Current system** pane, select a volume on your computer whose data you want to recover and press **Enter**.

2. Veeam Agent for Linux will display a window with information on the selected volume (partition type, file system type, mount point and volume size) and a list of available operations:
   - **Restore volume from** — select this option if you want to recover the selected volume from the backup.
   - **Delete partition** [for simple volumes] or **Delete volume** [for LVM volumes] — select this option if you want to change the disk layout before restoring a volume. After you delete a partition or volume, you will be able to create a new partition or volume of the desired size and map a volume in the backup to the volume on your computer.
   - **[For simple volumes]** Create LVM physical volume — select this option if you want to create an LVM physical volume on the selected disk partition. In the created physical volume, you will be able to create a volume group and restore to this volume group LVM logical volumes from the backup.
   - **Close** — select this option if you want to close the window and select another volume.
3. Select the **Restore volume from** option and press **Enter**.

![Veeam Agent for Linux window](image1)

4. Veeam Agent for Linux will display a window with a list of volumes in the backup. Select the volume that you want to restore and press **Enter**.

![Veeam Agent for Linux window](image2)
5. In the **Current system** pane, in the **Restore** column, Veeam Agent will display which volume from backup will be restored to the target volume.

6. Repeat steps 1–5 for all volumes that you want to restore.

7. Press 's' to start the restore process.

**Mapping Source Disk to Target Disk**

The **In backup** pane of the **Veeam Recovery Media** wizard contains a list of disks and volumes in the backup. As well as individual volumes, you can select for restore entire computer disks.
To map a source disk to a target disk:

1. In the **In backup** pane, select a disk in the backup volumes on which you want to recover and press **Enter**.

2. Veeam Agent for Linux will display a window with information on the selected disk (partition table type, bootloader type and disk size) and a list of available operations:
   - **Restore whole disk to** — select this option if you want to restore all volumes on the selected disk in the backup to your computer.
   - **Restore bootloader to** — select this option if you want to restore a bootloader from the disk in the backup to your computer.
   - **Close** — select this option if you want to close the window and select another disk or volume.
3. To restore volumes that reside on the selected disk, select the **Restore whole disk to** option and press **Enter**.

</table>

6. Repeat steps 1-5 for all computer disks whose volumes you want to restore.

7. Press ‘s’ to start the restore process.

### Mapping Target Disk to Source Disk

The **Current system** pane of the **Veeam Recovery Media** wizard displays a partition table of your computer booted from the Veeam Recovery Media. As well as individual volumes, you can select for restore entire computer disks. If necessary, you can edit the disk layout before restoring volumes.
To map a target disk to a source disk:

1. In the **Current system** pane, select a disk on your computer to which you want to restore volumes and press **Enter**.

![Veeam Recovery Media](image)

- **Device** | **Restore** | **Size**
  - sda (boot) |  | 60.00G
  - sda1 |  | 18.63G
  - sda2 |  | 38.31G
  - sda3 |  | 3.06G
  - sdb (boot) |  | 10.00G
  - sdb1 (lvm) |  | 10.00G
  - vg |  | 10.00G
  - lu1 |  | 5.00G
  - lu2 |  | 5.00G

2. Veeam Agent for Linux will display a window with information on the selected disk (partition table type, bootloader type and disk size) and a list of available operations:
   - **Restore whole disk from** — select this option if you want to restore to the selected disk all volumes from a disk in the backup.
   - **Restore bootloader from** — select this option if you want to restore to the selected disk a bootloader from a disk in the backup.
   - **Delete partition table** — select this option if you want to change the disk layout before restoring volumes. After you delete a partition table, you will be able to create a new partition table, create disk partitions and volumes of the desired size, and map volumes in the backup to volumes on your computer.
   - **Close** — select this option if you want to close the window and select another disk or volume.
3. To restore volumes to the selected disk, select the **Restore whole disk from** option and press **Enter**.

4. Veeam Agent for Linux will display a list of disks and volumes in the backup. Select the disk whose volumes you want to restore and press **Enter**.
5. In the **Current system** pane, in the **Restore** column, Veeam Agent will display which volumes from the disk in the backup will be restored to the target disk.

6. Repeat steps 1–5 for all disks whose volumes you want to restore.

7. Press ‘s’ to start the restore process.

### Mapping Btrfs Subvolumes

If the backup contains Btrfs file system data, in the **In backup** pane of the **Veeam Recovery Media** wizard, Veeam Agent displays the list of backed-up Btrfs subvolumes. Information about the original Btrfs pool that contained these subvolumes is not included in the backup.

You can restore from the backup all Btrfs subvolumes or selected subvolumes. To restore a subvolume, you must specify a target Btrfs pool — a Btrfs pool on the computer where you perform restore using the Veeam Recovery Media.

You can restore Btrfs subvolumes to the original Btrfs pool or new Btrfs pool. If the target Btrfs pool contains a subvolume with the same name as the name of the subvolume that you selected for restore, Veeam Agent will automatically map these subvolumes. During the restore process, Veeam Agent will overwrite data on the target subvolume with the data retrieved from the backup.

**NOTE:**

Veeam Agent for Linux does not check whether the target Btrfs pool has enough disk space to restore the selected subvolumes. If the total size of the restored data is larger than the size of the target Btrfs pool, after the restore process completes, the restored data will be corrupted.
To map a source Btrfs subvolume to a target Btrfs pool:

1. In the **In backup** pane, select a subvolume in the backup whose data you want to restore and press **Enter**.

   You can also choose to restore all subvolumes from the backup at once. To do this, in the **In backup** pane, select **btrfs** and press **Enter**.

   ![Backup Media Table](image)

   2. In the displayed window, select the necessary option for Btrfs restore and press **Enter**. The available options depend on what Btrfs subvolumes you selected for restore: all subvolumes or specific subvolume.

      - **Restore subvolume to** — this option is available if you chose to restore a specific Btrfs subvolume from the backup. Select this option to restore the selected subvolume to your computer.

      - **Restore btrfs to** — this option is available if you chose to restore all Btrfs subvolumes from the backup. Select this option to restore subvolumes to your computer.
3. Veeam Agent for Linux will display a list of Btrfs pools on your computer. Select the Btrfs pool where you want to restore data from the backup and press `Enter`.
4. In the **Current system** pane, in the **Restore** column, Veeam Agent for Linux will display which subvolume from backup will be restored to the target Btrfs pool.

Enter Select S Start restore Backspace Back Esc Main menu

5. If you want to restore more than one subvolume, repeat steps 1–4 for all subvolumes that you want to restore.

6. Press `s` to start the restore process.
Step 9. Complete Restore Process

At the **Recovery summary** step of the wizard, complete the procedure of volume-level restore.

1. Review the specified recovery settings.

2. Press **Enter** to start the volume-level restore process. Veeam Agent for Linux will perform partition re-allocation operations if necessary, restore the necessary data from the backup and overwrite data on your computer with it.
Step 10. Finish Working with Veeam Recovery Media

When the restore operation completes, finish working with the Veeam Recovery Media and start your operating system.

1. Press **Esc** to return to the Veeam Recovery Media main menu.
2. Eject the media or removable storage device with the recovery image.
3. In the Veeam Recovery Media main menu, select the **Reboot** option and press **Enter**.
4. Wait for your Linux operating system to start.
Restoring Files and Folders

If some files and folders on your computer get lost or corrupted, you can restore them from backups. For file-level restore, you can use backups of any type:

- Volume-level backups (backups of the entire computer or specific volumes)
- File-level backups

When you perform file-level restore with the Veeam Recovery Media, Veeam Agent publishes the backup content directly into the recovery image OS file system and displays it in the file browser. You can restore files and folders to their initial location or copy files and folders to a new location.

Before You Begin

Before you boot from the recovery image and recover your data, check the following prerequisites:

- You must have a recovery image on any type of media: CD/DVD/BD or removable storage device.
- To recover data on your computer, you must have both the Veeam Recovery Media and data backup. For data recovery, you can use a volume-level or file-level backup created with Veeam Agent for Linux. Make sure that the backup or system image is available on the computer drive (local or external), on a network shared folder or on the backup repository managed by a Veeam backup server.
- The media type on which you have created the recovery image must be set as a primary boot source on your computer.
- The backup from which you plan to restore data must be successfully created at least once.
- [For backups stored in network shared folders, on Veeam backup repositories and Veeam Cloud Connect repositories] You must have access to the target location where the backup file resides.
- [For Veeam backup repository targets] If you plan to restore data from a backup stored on a Veeam backup repository, you must have access permissions on this backup repository. To learn more, see Setting Up User Permissions on Backup Repositories.
- Veeam Recovery Media 3.0 and later versions do not support Oracle VM virtual machines. Use an earlier version of Veeam Recovery Media or contact Veeam Customer Support for workarounds.
Step 1. Boot from Veeam Recovery Media

To boot from the Veeam Recovery Media:

1. [For CD/DVD/BD] Power on your computer. Insert the media with the recovery image to the drive and power off the computer.
   [For removable storage device] Attach the removable storage device with the recovery image to your computer.

2. Start your computer.

3. Wait for Veeam Agent for Linux to load files from the Veeam Recovery Media.

4. After the recovery image OS has loaded, accept the terms of the product license agreement and license agreements for third-party components of the product:
   a. Make sure that the **I accept Veeam End User Software License Agreement** option is selected and press **Space**.
   b. Select the **I accept the terms of the following 3rd party software components license agreements** option with the **Tab** key and press **Space**.
   c. Switch to the **Continue** button with the **Tab** key and press **Enter**.

5. Make sure that network settings are specified correctly and configure the network adapter if necessary. To learn more, see **Configure Network Settings**.

6. Choose the necessary recovery option. Veeam Agent offers the following tools:
   o **Restore volumes** — the Veeam Recovery wizard to recover data on the original computer or perform bare-metal recovery.
   o **Restore files** — the File Level Restore wizard to restore files and folders to the original location or to a new location.
Switch to command line — Linux shell prompt with standard utilities to diagnose problems and fix errors.

TIP:
To stop working with the Veeam Recovery Media and shut down or restart your computer, in the Veeam Recovery Media main menu, select the Reboot or Shutdown option and press Enter.
Step 2. Configure Network Settings

To open the **Network settings** dialog, in the Veeam Recovery Media main menu, select the **Configure network** option and press **Enter**.

Veeam Agent for Linux will display network adapters that are available on the system. If there is a DHCP server in your network, Veeam Agent will configure the network settings automatically and display the IP address assigned to the network adapter. You can then press **Esc** to return to the Veeam Recovery Media main menu and launch the Volume Restore wizard.

You can manually configure TPC/IP v4 settings for network adapters if necessary. To learn more, see **Specifying Network Settings**.

---

**Specifying Network Settings**

You can manually configure TPC/IP v4 settings for the network adapter. To configure network settings:

1. In the **Choose adapter** list, select the network adapter that you want to use to connect to the network shared folder or Veeam backup repository where the backup resides and press **Enter**.
2. In the **Configure adapter** dialog, select the **Manual** option and press **Enter**.
3. In the **Adapter settings** dialog, specify the following network settings:
   - IP address
   - Subnet mask
   - Default gateway
   - DNS server
4. Select the **Apply** button and press **Enter**.
If there is a DHCP server in your network, you can return to automatic IP addressing:

1. In the **Choose adapter** list, select the necessary network adapter and press **Enter**.

2. In the **Configure adapter** dialog, select the **Auto** option and press **Enter**. Veeam Agent will automatically configure network settings for the adapter.
Step 3. Launch File Level Restore Wizard

To launch the file-level restore wizard, in the Veeam Recovery Media main menu, select **Restore files** and press **Enter**.
Step 4. Select Backup Location

At the **Select backup location** step of the wizard, specify where the backup file that you want to use for data recovery is located.

To recover data from backup, you need to mount the backup storage on which the backup file resides to the recovery image OS file system. Veeam Agent automatically mounts external USB drives that are connected to the computer and displays them in the list of available backup locations. You can select the necessary device and press **Enter** to pass to the **Browse for backup files** step of the wizard.

If the backup file is located in a network shared folder or on a local drive, select one of the following options:

- **Add shared folder** — select this option if the backup file is located in a network shared folder. With this option selected, you will pass to the **Mount shared folder** step of the wizard.

- **Mount local disk** — select this option if the backup file resides on the local computer drive, external drive or removable storage device that is currently connected to your computer. With this option selected, you will pass to the **Select local disk** step of the wizard.

- **Add VBR server** — select this option if the backup file resides on a backup repository managed by the Veeam backup server. With this option selected, you will pass to the **Specify backup server parameters** step of the wizard.

- **Add Cloud provider** — select this option if the backup file resides on a cloud repository exposed to you by a Veeam Cloud Connect service provider. With this option selected, you will pass to the **Specify Cloud provider parameters** step of the wizard.
Step 5. Specify Backup Location Settings

Specify settings for the target storage that contains a backup file from which you plan to restore data:

- **Specify shared folder settings** — if you have selected the *Add shared folder* option at the *Select backup location* step of the wizard.

- **Select local drive** — if you have selected the *Mount local disk* option at the *Select backup location* step of the wizard.

- **Specify Veeam backup repository settings** — if you have selected the *Add VBR server* option at the *Select backup location* step of the wizard.

- **Specify Veeam Cloud Connect repository settings** — if you have selected the *Add Cloud provider* option at the *Select backup location* step of the wizard.

Specifying Shared Folder Settings

The *Mount shared folder* step of the wizard is available if you have selected to restore data from a backup file located in a network shared folder.

Specify settings for the network shared folder:

1. Select the type of a network shared folder:
   - **NFS** — to connect to a network shared folder using the NFS protocol.
   - **SMB** — to connect to a network shared folder using the SMB (CIFS) protocol.

2. In the **Path** field, specify the network shared folder name in the **SERVER/DIRECTORY** format: type an IP address or domain name of the server and the name of the network shared folder in which the backup file resides.

3. [For SMB network shared folder] In the **Domain** field, type a name of the domain in which the account that has access permissions on the shared folder is registered, for example: **DOMAIN**.

4. [For SMB network shared folder] In the **Username** field, type a name of the account that has access permissions on the shared folder.

5. [For SMB network shared folder] In the **Password** field, type a password of the account that has access permissions on the shared folder.
TIP:
You can mount several network shared folders to work with backup files that are stored in different locations if needed. To do this, return to the Select Backup Location step of the wizard and select the Add shared folder option once again. For every mounted location, Veeam Agent displays its name, type and mount point. You can view the list of mounted network shared folders and browse for a backup file located on the necessary storage.

Selecting Local Drive

The Select local disk step of the wizard is available if you have selected to restore data from a backup file located on a computer drive.

In the list of devices, select the necessary disk or disk partition and press Enter. Veeam Agent will mount the selected device to the /media directory of the recovery image OS file system and display content of the directory.
TIP:

You can mount several devices to work with backup files that are stored in different locations if needed. To do this, return to the Select Backup Location step of the wizard and select the Mount local disk option once again. For every mounted location, Veeam Agent displays its name, type and mount point. You can view the list of mounted devices and browse for a backup file located on the necessary storage.

Specifying Backup Server Parameters

The Specify backup server parameters step of the wizard is available if you have selected to restore data from a backup repository managed by the Veeam backup server.

Specify settings for the Veeam backup server that manages the backup repository where the backup file resides:

1. In the Address field, specify a DNS name or IP address of the Veeam backup server.
2. In the Port field, specify a number of the port over which Veeam Agent must communicate with the backup repository. By default, Veeam Agent uses port 10006.
3. In the Login field, type a name of the account that has access to the Veeam backup repository.
4. In the Domain field, type a name of the domain in which the account that has access to the Veeam backup repository is registered, for example: DOMAIN.
5. In the Password field, type a password of the account that has access to the Veeam backup repository.
6. Press **Enter**. Veeam Agent will connect to the Veeam backup server, and you will pass immediately to the **Backup** step of the wizard.

### Specifying Service Provider Settings

If you have selected to restore data from a backup file located on a Veeam Cloud Connect repository, specify settings to connect to the cloud repository:

1. **Specify service provider settings.**
2. **Verify the TLS certificate.**
3. **Specify user account settings.**

#### Specifying Service Provider Settings

The **Specify Cloud provider parameters** step of the wizard is available if you have selected to restore data from a cloud repository exposed to you by a Veeam Cloud Connect service provider.

Specify service provider settings that the SP or your backup administrator has provided to you:

1. In the **DNS name or IP address** field, enter a full DNS name or IP address of the cloud gateway.
2. In the **Port** field, specify the port over which Veeam Agent will communicate with the cloud gateway. By default, port 6180 is used.
3. Press **Enter**. Veeam Agent will connect to the service provider and display the Certificate details window.

Verifying TLS Certificate

In the Certificate details window, review information about the TLS certificate obtained from the SP side and verify the TLS certificate.

- To accept the TLS certificate, select the **Accept** button with the **Tab** key and press **Enter**.
- [Optional] To verify the TLS certificate with a thumbprint, do the following:
  a. Select the **Verify thumbprint** button with the **Tab** key and press **Enter**.
  b. In the **Thumbprint verification** field, enter the thumbprint that you obtained from the SP.
c. Switch to the **Verify** button and press **Enter**. Veeam Agent for Linux will check if the thumbprint that you entered matches the thumbprint of the obtained TLS certificate.

TLS certificate verification is optional. You can use this option to verify self-signed TLS certificates. TLS certificates signed by the CA do not require additional verification.

---

**Specifying User Account Settings**

The **Specify Cloud provider credentials** step of the wizard is available if you have chosen to restore data from a cloud repository and specified settings for the cloud gateway.

1. In the **Username** field, type a name of the tenant or subtenant account that the SP or your backup administrator has provided to you. The name of the subtenant account must be specified in the **TENANT\SUBTENANT** format.

2. In the **Password** field, provide a password for the tenant or subtenant account.
3. Press **Enter**. Veeam Agent for Linux will connect to the cloud repository, and you will pass immediately to the **Backup** step of the wizard.
Step 6. Browse for Backup File

At the **Browse for backup files** step of the wizard, select the backup file that you plan to use for volume-level restore:

1. In the file system tree, select a directory in which the backup file you plan to use for restore resides:
   - Use **Up** and **Down** arrow keys to select a directory.
   - Use the **Enter** key to open the necessary directory.

2. In the directory where the backup file resides, select the backup file and press **Enter**.
Step 7. Select Backup and Restore Point

At the Backup step of the wizard, select a backup and restore point from which you want to recover data.

The Backup step window comprises two panes:

- The **Imported backups** pane on the left displays information about backup: host name of the computer whose data is stored in the backup file, backup job name and number of restore points.
- The **Restore points** pane on the right displays a list of restore points in the backup.

To select backup and restore point:

1. In the **Imported backups** pane, ensure that the backup from which you want to recover data is selected and press **Enter**.

   If you want to select another backup, press the ‘i’ key and browse for the necessary backup file. To learn more, see Locate Backup File.

2. In the **Restore points** pane, select with **Up** and **Down** keys the restore point from which you want to recover data and press **Enter**.
NOTE:
If you selected an encrypted backup for data restore, Veeam Agent will prompt you to provide a password to unlock the encrypted file. To learn more, see Restoring Data from Encrypted Backups.

### Veeam Recovery Media

<table>
<thead>
<tr>
<th>IMPORTED BACKUPS</th>
<th>RESTORE POINTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job name</td>
<td>Hostname</td>
</tr>
<tr>
<td>DocBackup</td>
<td>srv42</td>
</tr>
<tr>
<td>Show all...</td>
<td></td>
</tr>
</tbody>
</table>
3. Veeam Agent will mount the content of the backup file to the `/mnt/backup` directory in the recovery image OS file system and display a notification window with the corresponding message. Press **Enter** to proceed to the File Level Restore wizard menu, open the file manager and save restored files.

When you perform file-level restore with the File Level Restore wizard, Veeam Agent always mounts the backup to the `/mnt/backup` directory. If you want to specify another directory for backup mount, you can perform file-level restore with the Veeam Agent command line interface. To learn more, see **Restoring Files and Folders with Command Line Interface**.
Step 8. Save Restored Files

When the backup file content is mounted to the recovery image OS file system, Veeam Agent opens the File Level Restore wizard menu displaying a list of available operations.

You can perform the following operations with file-level backup:

- **Start file commander** — select this option if you want to start the file manager and work with restored files and folders. To learn more, see Working with Midnight Commander.

- **Stop backup mount** — select this option if you want to stop the backup mount session and unmount the backup file content from the `/mnt/backup` directory of the recovery image OS file system. To learn more, see Stopping Backup Mount Session.

- **Switch to command line** — select this option if you want to open the Linux shell prompt and use common Linux command-line tools.

**TIP:**
To stop working with the Veeam Recovery Media and shut down or restart your computer, in the File Level Restore wizard menu, select the **Reboot** or **Shutdown** option and press **Enter**.

![Image of Midnight Commander menu]

Working with Midnight Commander

To work with restored files and folders, you can use Midnight Commander — a file manager that is included into the Veeam Recovery Media. With the Midnight Commander file manager, you can browse the mounted backup content and file system on your computer, and save restored files and folders to the original location or to a new location.

To launch the file manager, in the File Level Restore wizard menu, select **Start file browser** and press **Enter**.
When you launch Midnight Commander, Veeam Agent displays in the file manager the directory with the backup content and your computer’s file system:

- In the left pane, Veeam Agent displays a directory of your computer’s file system mounted under the /mnt/system directory of the recovery image OS file system. By default, Veeam Agent mounts to the recovery image OS file system the following volumes of your computer:
  - If you use a volume-level backup for file-level restore, Veeam Agent detects the partition table in the backup, mounts to the /mnt/system directory block devices that represent volumes of your computer with the same names as volumes in the backup. For example, if your volume-level backup contains /dev/sdal and /dev/sd6 volumes with / and /home mount points, Veeam Agent will mount to the /mnt/system directory both root (/) and /home partitions.
  - If you use a file-level backup for file-level restore, Veeam Agent mounts to the /mnt/system directory only the system volume of your computer, for example, /dev/sdal. If you want to save restored files and folders to a directory on another computer volume or to a network shared folder, you need to mount this volume or folder manually. To mount a target storage for restored files:
    i. In Midnight Commander, press **F10** to close the file manager.
    ii. In the File Level Restore wizard menu, select the Switch to command line option and press **Enter**.
    iii. Mount the target storage for the restored files and folders with the `mount` command.

- In the right pane, Veeam Agent displays a directory in which the backup content is mounted. Veeam Agent mounts the backup content under the /mnt/backup folder.

While the Midnight Commander file manager is open, you can perform the following operations with restored files and folders:

- **Save files to initial location**
- **Save files to a new location**

After you finish working with files and folders, finish working with the Veeam Recovery Media.
Saving Files to Initial Location

To save restored files or folders to their initial location on your computer, do the following:

1. In the left pane of the file manager window, open the directory in your computer’s file system in which the backed-up file or folder that you want to restore originally resided.

2. In the right pane of the file manager window, open the directory that contains the file or folder in the backup that you want to restore to its original location.

3. Select the file or folder that you want to restore and press F5.

4. In the Copy dialog window, review the file or folder copy settings, select Ok and press Enter.
5. If the file or folder you want to restore exists in its original location, Midnight Commander will display a warning. In the warning window, select the necessary operation with the target file or folder and press **Enter**. Midnight Commander will save the file or folder in its original location.

<table>
<thead>
<tr>
<th>Left</th>
<th>File</th>
<th>Command</th>
<th>Options</th>
<th>Right</th>
</tr>
</thead>
<tbody>
<tr>
<td>..</td>
<td>n</td>
<td>Up-Dir</td>

</tr>
<tr>
<td>Report2.pdf</td>
<td>356664</td>
<td>Sep 25</td>
<td>356664</td>
<td>Sep 25</td>
</tr>
</tbody>
</table>

6. After you finish working with files and folders, press **F10** to close the file manager.

**Saving Files to New Location**

To save restored files or folders to a new location on your computer or to a network shared folder, do the following:

1. In the left pane of the file manager window, open the directory in your computer’s file system in which you want to restore a file or folder.

2. In the right pane of the file manager window, open the directory that contains the file or folder in the backup that you want to restore.

3. Select the file or folder that you want to restore and press **F5**.
4. In the **Copy** dialog window, review the file or folder copy settings, select **Ok** and press **Enter**.

![Copy dialog window]

5. Midnight Commander will save the file or folder to the specified location.

![Midnight Commander window]

6. After you finish working with files and folders, press **F10** to close the file manager.

**Stopping Backup Mount Session**

When Veeam Agent mounts a backup for file-level restore, Veeam Agent starts a new backup mount session. To unmount a backup, you need to stop the backup mount session. This may be required, for example, if you want to stop working with files and folders in one backup and mount another backup for file-level restore.
To stop the backup mount session with the Veeam Recovery Media, in the File Level Restore wizard menu, select the **Stop backup mount** option and press **Enter**. Veeam Agent will stop the backup mount session, unmount the backup from the `/mnt/backup` directory of the recovery image OS file system, exit the File Level Restore wizard and display the Veeam Recovery Media main menu.
Step 9. Finish Working with Veeam Recovery Media

When the restore operation completes, finish working with the Veeam Recovery Media and start your operating system.

1. Eject the media or removable storage device with the recovery image.
2. In the File Level Recovery wizard menu or Veeam Recovery Media main menu, select the Reboot option and press Enter.
3. Wait for your Linux operating system to start.
Restoring Volumes with Command Line Interface

You can restore a specific computer volume or all volumes from the volume-level backup.

**NOTE:**
You cannot use the Veeam Agent for Linux command line interface to restore Btrfs subvolumes.

Volumes can be restored to their original location or to a new location.

- If you restore a volume to its original location, Veeam Agent will overwrite the data on the original volume with the data restored from the backup.
- If you restore volume data to a new location, Veeam Agent will restore data from the backup and write it to the selected destination. If necessary, you can specify new disk mapping settings for the restored volume.

You can use Veeam Agent commands to restore volumes from a backup or restore point:

- **Restore from backup**
  When you restore a volume from the backup, Veeam Agent will automatically select the latest restore point in the backup. The volume will be restored to the state in which the volume was at the time when the latest restore point was created.

- **Restore from a restore point**
  When you restore a volume from the restore point, you can select the necessary restore point in the backup to recover data to a specific point in time.
Before You Begin

Before you begin the volume-level restore process, check the following prerequisites:

- The volume-level backup from which you plan to restore data must be successfully created at least once.
- [For backups stored in network shared folders and on Veeam backup repositories] You must have access to the target location where the backup file resides.
- [For Veeam backup repository targets] If you plan to restore data from a backup stored on a backup repository, you must have access permissions on this backup repository. To learn more, see Setting Up User Permissions on Backup Repositories.

Volume-level restore has the following limitations:

- You cannot restore the system volume to its original location.
- You cannot restore a volume to the volume on which the Linux swap space is hosted.
- You cannot restore a volume to the volume where the backup file that you use for restore is located.

To overcome the first two limitations, you can boot from the recovery image and use the Veeam Recovery Media tools for volume-level restore. To learn more, see Restoring from Veeam Recovery Media.
Restoring from Backup

With Veeam Agent command line interface, you can restore volumes from the backup. When you restore a volume from the backup, Veeam Agent automatically selects the latest restore point in the backup and restores the volume to the state in which the volume was at the time when the latest restore point was created.
Step 1. Locate Backup

To view a list of backups created by Veeam Agent, use the following command:

```
veeamconfig backup list --all
```

In the list of backups, Veeam Agent displays information about all Veeam Agent for Linux backups stored in all backup repositories. If Veeam Agent is connected to a Veeam backup server, all Veeam Agent for Linux backups that are kept on Veeam backup repositories managed by this server also appear in this list.

The `--all` parameter is optional. If you do not use this option, Veeam Agent displays information about backups created by the current Veeam Agent computer only.

For each backup, Veeam Agent displays the following information:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Job name</strong></td>
<td>Host name of the computer on which the backup job was configured and name of the job by which the backup was created.</td>
</tr>
<tr>
<td><strong>Backup ID</strong></td>
<td>ID of the backup.</td>
</tr>
<tr>
<td><strong>Repository</strong></td>
<td>Name of the backup repository in which the backup was created.</td>
</tr>
</tbody>
</table>

Imported backups are marked as `Imported` in the `Repository` column. For information about the import procedure, see Importing Backups.

For example:

```
user@srv01:~$ veeamconfig backup list --all
Job name                     Created at            Backup ID                               Repository
  srv01 SystemBackup         1 2016-11-11 17:37   {45f074d2-d2d9-423d-84e9-8f1798b08d4c} Repository_
  srv01 DocumentsBackup      1 2016-11-11 18:30   {ea64a7e5-038a-4c86-970a-6d59d4cf3968} Repository_
  srv01 HomePartitionBackup  1 2016-11-15 11:28   {4f75bb20-a6b6-4323-9287-1c6c8ceccc6b} Repository_
  wrk01 SystemBackup         2 2016-11-13 15:26   {951ac571-dd29-45ac-8624-79b8cccb45863} Repository_
  wrk02 SystemBackup         2 2016-11-13 15:59   {8d6d4d39-51b2-48b1-ac7a-84f2d6dbc167} Repository_
```

**TIP:**

If you want to recover data from a backup that is stored in another location, for example, a backup created with another instance of Veeam Agent, you can import such backup into the Veeam Agent database on your computer. To learn more, see Importing Backups.
Step 2. Explore Backup Content

To view detailed information about specific backup, use the following command:

```
veeamconfig backup show --id <backup_id>
```

where:

- `<backup_id>` — ID of the backup for which you want to view detailed information.

For a volume-level backup, Veeam Agent displays the following information:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Machine name</td>
<td>Host name of the machine on which the backup job is configured and the name of the job.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the volume in the backup.</td>
</tr>
<tr>
<td>Device</td>
<td>Path to the block device that represents the volume.</td>
</tr>
<tr>
<td>FS UUID</td>
<td>File system ID.</td>
</tr>
<tr>
<td>Offset</td>
<td>Position of the volume on the computer disk.</td>
</tr>
<tr>
<td>Size</td>
<td>Size of the volume in the backup.</td>
</tr>
</tbody>
</table>

For example:

```
user@srv01:$ veeamconfig backup show --id 4f75bb20-a6b6-4323-9287-1c6c8cecccb6
  Machine name: srv01 HomePartitionBackup
    Name: [sda6]
    Device: [/dev/sda6]
    FS UUID: [4967f2eb-e8bb-48fe-a694-5ba67b9030a5]
    Offset: [11813257216] bytes (23072768 sectors)
    Size: [41872785408] bytes (81782784 sectors)
```
Step 3. Start Restore Process

To start the process of volume-level restore from the backup, use the following command:

```
veeamconfig backup restore --id <backup_id> --targetdev <target_volume> --backupdev <volume_in_backup>
```

where:

- `<backup_id>` — ID of the backup.
- `<target_volume>` — path to a block device that represents a volume on your computer that you want to recover.
- `<volume_in_backup>` — path to a block device that represents a volume in the backup.

This parameter is optional. If you do not specify this parameter, Veeam Agent will restore from the backup a volume that has the same name as a `<target_volume>.

For example:

```
user@srv01:~$ veeamconfig backup restore --id 4f75bb20-a6b6-4323-9287-1c6c8cecc6b --targetdev /dev/sdb --backupdev /dev/sda6
Restoring backup.
Backup: 4f75bb20-a6b6-4323-9287-1c6c8cecc6b
Devices:
  Device in current system: [/dev/sdb] In backup: [/dev/sda6];
You are sure? (y/n)
y
Volume restore from backup has been started.
Session ID: [{0b72ef45-4c88-4639-b940-ad3828b1cd4e}].
Logs stored in: [/var/log/veeam/Restore/Session_{0b72ef45-4c88-4639-b940-ad3828b1cd4e}].
```

**IMPORTANT!**

You can restore a backed-up volume only to a target volume that is not used by your Linux OS (that does not have file system mount points). For example, you can add a new disk to your computer and restore a volume in the backup to this disk. To restore a volume to its original location or to another volume used by Linux OS, you should boot from the Veeam Recovery Media and perform volume-level restore with the Volume Restore wizard.
Step 4. Monitor Restore Process

You can monitor the restore process by viewing the restore session log in the command line interface.

To view Veeam Agent for Linux session log, use the following command:

```
veeamconfig session log --id <session_id>
```

where:

<session_id> — ID of the restore session.

For example:

```
user@srv01:$ veeamconfig session log --id 0b72ef45-4c88-4639-b940-ad3828b1cd4e
2016-11-27 11:04:04 UTC {b141f32a-3e77-45a6-b55a-c100a1464d67} [info] Job started

2016-11-27 11:14:37 UTC {ced9af4a-6af1-4756-8ff8-8ec1325e18ec} [info] sdb restored 6.5GB at 10.6MB/s
2016-11-27 11:14:37 UTC {8b87d4a2-1c80-4e14-bbf1-45a3612bc3a7} [info] Volume restore completed
```

TIP:

You can also check the restore session status with the `veeamconfig session info` command. To learn more, see Viewing Session Status.
Restoring from Restore Point

With Veeam Agent command line interface, you can restore volumes from the specific restore point. When you restore a volume from the restore point, you can select the necessary restore point in the backup to recover data to a desired point in time.
Step 1. Locate Backup

To view a list of backups created by Veeam Agent, use the following command:

```
veeamconfig backup list --all
```

In the list of backups, Veeam Agent displays information about all Veeam Agent for Linux backups stored in all backup repositories. If Veeam Agent is connected to a Veeam backup server, all Veeam Agent for Linux backups that are kept on Veeam backup repositories managed by this server also appear in this list.

The `--all` parameter is optional. If you do not use this option, Veeam Agent displays information about backups created by the current Veeam Agent computer only.

For each backup, Veeam Agent displays the following information:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Job name</strong></td>
<td>Host name of the computer on which the backup job was configured and name of the job by which the backup was created.</td>
</tr>
<tr>
<td><strong>Backup ID</strong></td>
<td>ID of the backup.</td>
</tr>
<tr>
<td><strong>Repository</strong></td>
<td>Name of the backup repository in which the backup was created. Imported backups are marked as <em>Imported</em> in the <strong>Repository</strong> column. For information about the import procedure, see <em>Importing Backups</em>.</td>
</tr>
<tr>
<td><strong>Created at</strong></td>
<td>Date and time of the backup creation.</td>
</tr>
</tbody>
</table>

For example:

```
user@srv01:~$ veeamconfig backup list --all
Job name          Backup ID                          Repository
srv01 SystemBackup {45f074d2-d2d9-423d-84e9-8f1798b08d4c} Repository_
  1 2016-11-11 17:37
srv01 DocumentsBackup {ea64a7e5-038a-4c86-970a-6d59d4cf3968} Repository_
  1 2016-11-11 18:30
srv01 HomePartitionBackup {4f75bb20-a6b6-4323-9287-1c6c8cecc6b} Repository_
  2 2016-11-15 11:28
wrk01 SystemBackup {951ac571-dd29-45ac-8624-79b8ccbc45863} Repository_
  2 2016-11-13 15:26
wrk02 SystemBackup {8d6d4d39-51b2-48b1-ac7a-84f2d6d6bc167} Repository_
  3 2016-11-13 15:59
```

**TIP:**

If you want to recover data from a backup that is stored in another location, for example, a backup created with another instance of Veeam Agent, you can import such backup into the Veeam Agent database on your computer. To learn more, see *Importing Backups*. 
Step 2. Explore Restore Points

To view information about restore points in the backup, use the following command:

```bash
veeamconfig backup info --id <backup_id>
```

or

```bash
veeamconfig point list --backupid <backup_id>
```

where

`<backup_id>` — ID of the backup for which you want to view information on restore points.

You can view the following information about restore points in the backup:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job name</td>
<td>Name of the backup job by which the backup was created.</td>
</tr>
<tr>
<td>OIB ID</td>
<td>ID of the restore point in the backup.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of the restore point. Possible values:</td>
</tr>
<tr>
<td>Created at</td>
<td>Date and time of the restore point creation.</td>
</tr>
<tr>
<td>Is corrupt</td>
<td>Indicates whether restore point in the backup is corrupted. Possible values:</td>
</tr>
</tbody>
</table>

For example:

```bash
user@srv01:~$ veeamconfig backup info --id 4f75bb20-a6b6-4323-9287-1c6c8ceccb6b
Job name: srv01 HomePartitionBackup, Created at: 2016-11-15 11:28
OIB ID: 23cb927d-5e2d-42fe-a4a4-e5f254a6413e, Type: Full
Is corrupt: false
```

```bash
user@srv01:~$ veeamconfig point list --backupid 4f75bb20-a6b6-4323-9287-1c6c8ceccb6b
```

<table>
<thead>
<tr>
<th>Job name</th>
<th>OIB ID</th>
<th>Type</th>
<th>Date and time</th>
<th>Is corrupt</th>
</tr>
</thead>
<tbody>
<tr>
<td>HomePartitionBackup</td>
<td>{23cb927d-5e2d-42fe-a4a4-e5f254a6413e}</td>
<td>Full</td>
<td>2016-11-15 11:28</td>
<td>false</td>
</tr>
<tr>
<td>HomePartitionBackup</td>
<td>{25e31075-4c30-4d67-86a6-293c0887f4eb}</td>
<td>Increment</td>
<td>2016-11-15 11:58</td>
<td>false</td>
</tr>
<tr>
<td>HomePartitionBackup</td>
<td>{9375140d-720a-4d3e-a69b-ab9cf60d53fa}</td>
<td>Increment</td>
<td>2016-11-27 13:15</td>
<td>false</td>
</tr>
<tr>
<td>Job name</td>
<td>OIB ID</td>
<td>Type</td>
<td>C</td>
<td></td>
</tr>
<tr>
<td>---------------------------</td>
<td>----------------------------------------------------------</td>
<td>------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td>srv01 HomePartitionBackup</td>
<td>{23cb927d-5e2d-42fe-a4a4-e5f254a6413e}</td>
<td>Full</td>
<td>2</td>
<td></td>
</tr>
<tr>
<td>srv01 HomePartitionBackup</td>
<td>{25e31075-4c30-4d67-86a6-293c0887f4eb}</td>
<td>Increment</td>
<td>2</td>
<td></td>
</tr>
<tr>
<td>srv01 HomePartitionBackup</td>
<td>{9375140d-720a-4d3e-a69b-ab9cf60d53fa}</td>
<td>Increment</td>
<td>2</td>
<td></td>
</tr>
</tbody>
</table>

or

```
user@srv01:~$ veeamconfig point list --backupid 4f75bb20-a6b6-4323-9287-1c6c8ce ccb6b
```
Step 3. Start Restore Process

To start the process of volume-level restore from the specific restore point, use the following command:

```
veeamconfig point restore --id <point_id> --targetdev <target_volume> --backupdev <volume_in_backup>
```

where:

- `<point_id>` — ID of the restore point.
- `<target_volume>` — path to a block device that represents a volume on your computer that you want to recover.
- `<volume_in_backup>` — path to a block device that represents a volume in the backup.

This parameter is optional. If you do not specify this parameter, Veeam Agent will restore from the backup a volume that has the same name as a `<target_volume>`.

For example:

```
user@srv01:~$ veeamconfig point restore --id 9375140d-720a-4d3e-a69b-ab9cf60d53fa --backupdev /dev/sda6 --targetdev /dev/sdb
Restoring point.
Restore point: 9375140d-720a-4d3e-a69b-ab9cf60d53fa
Devices:
    Device in current system: [/dev/sdb]  In backup: [/dev/sda6];
You are sure? (y/n)
y
Volume restore by point has been started.
Session ID: [{697d9348-9001-4845-8764-3cc4fb3f296b}].
Logs stored in: [/var/log/veeam/Restore/Session_{697d9348-9001-4845-8764-3cc4fb3f296b}].
```

**IMPORTANT!**

You can restore a backed-up volume only to a target volume that is not used by your Linux OS (that does not have file system mount points). For example, you can add a new disk to your computer and restore a volume in the backup to this disk. To restore a volume to its original location or to another volume used by Linux OS, you should boot from the Veeam Recovery Media and perform volume-level restore with the Volume Restore wizard.
Step 4. Monitor Restore Process

You can monitor the restore process by viewing the restore session log in the command line interface.

To view Veeam Agent session log, use the following command:

```
veeamconfig session log --id <session_id>
```

where:

`<session_id>` — ID of the restore session.

For example:

```
user@srv01:~$ veeamconfig session log --id 697d9348-9001-4845-8764-3cc4fb3f296b
2016-11-27 10:35:47 UTC {ed66a1f6-5216-4596-a7b5-be10dd10c32f} [info] Starting volume restore

```

**TIP:**

You can also check the restore session status with the `veeamconfig session info` command. To learn more, see Viewing Session Status.
Restoring Files and Folders with Recovery Wizard

If some files and folders on your computer get lost or corrupted, you can restore them from backups. For file-level restore, you can use backups of any type:

- Volume-level backups (backups of the entire computer or specific volumes)
- File-level backups

When you perform file-level restore, Veeam Agent publishes the backup content directly into the computer file system. You can browse to files and folders in the backup, restore files and folders to their initial location, copy files and folders to a new location or simply target applications to restored files and work with them as usual.
Before You Begin

Before you begin the file-level restore process, check the following prerequisites:

- The backup from which you plan to restore data must be successfully created at least once.

- [For backups stored in network shared folders, on Veeam backup repositories and Veeam Cloud Connect repositories] You must have access to the target location where the backup file resides.

- [For Veeam backup repository targets] If you plan to restore data from a backup stored on a backup repository, you must have access permissions on this backup repository. To learn more, see Setting Up User Permissions on Backup Repositories.

- [For backups of Btrfs file system] A machine on which you perform file-level restore must run the same or later Linux kernel version as the machine on which the backup was created.

  For example, you created a backup of a machine that runs Linux kernel version 4.14. If you perform file-level restore from this backup on another machine that runs Linux kernel 2.6, the file-level restore process will fail.
Step 1. Launch File Level Restore Wizard

To launch the File Level Restore wizard, do the following:

1. Launch the Veeam Agent control panel with the `veeam` or `veeamconfig ui` command.
2. In the Veeam Agent control panel, press the 'r' key to proceed to the File Level Restore wizard.

### Latest backup sessions:

<table>

</tr>
</tbody>
</table>
Step 2. Select Backup and Restore Point

At the **Backup** step of the wizard, select a backup and restore point from which you want to recover data.

The **Backup** step window comprises two panes:

- The **Imported backups** pane on the left displays available backups and information about each backup: host name of the computer whose data is stored in the backup file, backup job name and number of restore points.
- The **Restore points** pane on the right displays a list of restore points in the backup.

To select backup and restore point:

1. In the **Imported backups** pane, select with **Up** and **Down** keys the backup from which you want to recover data and press **Enter**.

   In the list of backups, Veeam Agent displays backups that were created by backup jobs configured with Veeam Agent on your computer. If Veeam Agent for Linux is connected to a Veeam Backup & Replication server or a Veeam Cloud Connect service provider, backups created in the Veeam backup repository or cloud repository also appear in the list.

   By default, Veeam Agent displays in the list only those backups in the Veeam backup repository that were created under your account. If you used an account to which the Veeam Backup Administrator role is assigned to connect to the Veeam backup server, you can also view all Veeam Agent backups that are stored in the Veeam backup repository to which Veeam Agent is connected. To view such backups, click the **Show all** link at the bottom of the list.

   If Veeam Agent fails to display backups stored in the Veeam backup repository for some reason, you can press the ‘r’ key to rescan the backup repository. Veeam Agent will try to reconnect to the Veeam backup server and refresh the list of backups.
If you want to recover data from a backup that is stored in another location, for example, a backup created with another instance of Veeam Agent in a network shared folder, you can import such backup. Press the 'I' key, browse to the directory in which the backup file resides and select the necessary backup file. The selected backup file will be added to the list of backups.

2. In the **Restore points** pane, select with **Up** and **Down** keys the restore point from which you want to recover data and press **Enter**.
NOTE:
If you selected an encrypted backup for data restore, Veeam Agent will prompt you to provide a password to unlock the encrypted file. To lean more, see Restoring Data from Encrypted Backups.

<table>
<thead>
<tr>
<th>Job name</th>
<th>Hostname</th>
<th>Points</th>
<th>Created at</th>
</tr>
</thead>
<tbody>
<tr>
<td>srv02 DailyBackup</td>
<td>srv02</td>
<td>4</td>
<td>06:10 14-12-2017</td>
</tr>
<tr>
<td>srv02 CloudBackup</td>
<td>srv02</td>
<td>5</td>
<td>06:10 13-12-2017</td>
</tr>
<tr>
<td>srv02 CloudBackup(encrypted)srv02</td>
<td>srv02</td>
<td>2</td>
<td>06:00 12-12-2017</td>
</tr>
<tr>
<td>Show all...</td>
<td></td>
<td></td>
<td>22:14 11-12-2017</td>
</tr>
</tbody>
</table>
3. Veeam Agent will mount the content of the backup file to the /mnt/backup directory in the computer’s file system and display a notification window with the corresponding message. Press Enter to close the window and return to the Veeam Agent control panel.

TIP:
When you finish working with restored files and folders, you can unmount the backup from the /mnt/backup folder. To learn more, see Stop Backup Mount Session.
Step 3. Save Restored Files

When the backup file content is mounted to the `/mnt/backup` directory in the computer’s file system, you can use Linux command line utilities or preferred file browser to work with restored files and directories. You can browse for files and directories in the mounted backup and copy files and directories that you want to restore to their initial location or to a new location.

In the following example, the restored file `Report1.pdf` is copied from the mounted backup to the new location with Linux command line utilities:

```
user@srv01:~$ ls Documents/
Reports

user@srv01:~$ ls /mnt/backup/FileLevelBackup_0/home/user/Documents/Reports/

user@srv01:~$ cp /mnt/backup/FileLevelBackup_0/home/user/Documents/Reports/Report1.pdf Documents/

user@srv01:~$ ls Documents/
Report1.pdf  Reports
```
Step 4. Stop Backup Mount Session

When Veeam Agent mounts a backup for file-level restore, Veeam Agent starts a new backup mount session. To unmount a backup, you need to stop the backup mount session. This may be required, for example, if you want to stop working with files and folders in one backup and mount another backup for file-level restore. You can also stop the backup mount session to unmount a backup after you have finished working with restored files and folders.

To stop the backup mount session, do the following:

1. Launch the Veeam Agent control panel with the `veeam` or `veeamconfig ui` command:
2. In the Veeam Agent control panel, press the 'u' key to unmount a backup.
3. Veeam Agent will stop the backup mount session and display a notification window. Press Enter to close the window and return to the Veeam Agent control panel.
Restoring Files and Folders with Command Line Interface

If some files and folders on your computer get lost or corrupted, you can restore them from backups. For file-level restore, you can use backups of any type:

- Volume-level backups (backups of the entire computer or specific volumes)
- File-level backups

When you perform file-level restore, Veeam Agent publishes the backup content directly into the computer file system. You can browse to files and folders in the backup, restore files and folders to their initial location, copy files and folders to a new location or simply target applications to restored files and work with them as usual.

With the Veeam Agent command line interface, you can restore files and folders in a more flexible way than with the use of the File Level Restore wizard. In particular, you can specify a directory in which Veeam Agent should mount the backup file content for file-level restore. You can also mount several backups to different directories to work with files and folders restored from different backups simultaneously.

You can use Veeam Agent commands to restore files and folders from backup or from specific restore point:

- **Restore from backup**
  
  When you restore files and folders from the backup, Veeam Agent will automatically select the latest restore point in the backup. You can restore files and folders to the state in which they were at the time when the latest restore point was created.

- **Restore from a restore point**
  
  When you restore files and folders from the restore point, you can select the necessary restore point in the backup to recover data to a specific point in time.
Before You Begin

Before you begin the file-level restore process, check the following prerequisites:

- The backup from which you plan to restore data must be successfully created at least once.

- [For backups stored in network shared folders, on Veeam backup repositories and Veeam Cloud Connect repositories] You must have access to the target location where the backup file resides.

- [For Veeam backup repository targets] If you plan to restore data from a backup stored on a backup repository, you must have access permissions on this backup repository. To learn more, see Setting Up User Permissions on Backup Repositories.

- [For backups of Btrfs file system] A machine on which you perform file-level restore must run the same or later Linux kernel version as the machine on which the backup was created.

  For example, you created a backup of a machine that runs Linux kernel version 4.14. If you perform file-level restore from this backup on another machine that runs Linux kernel 2.6, the file-level restore process will fail.
Restoring from Backup

With Veeam Agent command line interface, you can restore files and folders from the backup. When you perform file-level restore from the backup, Veeam Agent for Linux automatically selects the latest restore point in the backup. You can restore files and folders to the state in which they were at the time when the latest restore point was created.
Step 1. Locate Backup

To view a list of backups created by Veeam Agent, use the following command:

```
veeamconfig backup list --all
```

In the list of backups, Veeam Agent displays information about all Veeam Agent for Linux backups stored in all backup repositories. If Veeam Agent is connected to a Veeam backup server, all Veeam Agent for Linux backups that are kept on Veeam backup repositories managed by this server also appear in this list.

The `--all` parameter is optional. If you do not use this option, Veeam Agent displays information about backups created by the current Veeam Agent computer only.

For each backup, Veeam Agent displays the following information:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job name</td>
<td>Host name of the computer on which the backup job was configured and name of the job by which the backup was created.</td>
</tr>
<tr>
<td>Backup ID</td>
<td>ID of the backup.</td>
</tr>
<tr>
<td>Repository</td>
<td>Name of the backup repository in which the backup was created. Imported backups are marked as <strong>Imported</strong> in the <em>Repository</em> column. For information about the import procedure, see <a href="#">Importing Backups</a>.</td>
</tr>
<tr>
<td>Created at</td>
<td>Date and time of the backup creation.</td>
</tr>
</tbody>
</table>

For example:

```
user@srv01:~$ veeamconfig backup list --all
Job name                   Backup ID                               Repository
srv01 SystemBackup         {45f074d2-d2d9-423d-84e9-8f1798b08d4c}  Repository_
  1  2016-11-11 17:37
srv01 DocumentsBackup      {ea64a7e5-038a-4c86-970a-6d59d4cf3968}  Repository_
  1  2016-11-11 18:30
srv01 HomePartitionBackup  {4f75bb20-a6b6-4323-9287-1c6c8cecc6b}  Repository_
  2  2016-11-15 11:28
wrk01 SystemBackup         {951ac571-dd29-45ac-8624-79b8ccb45863}  Repository_
  2  2016-11-13 15:26
wrk02 SystemBackup         {8d6d4d39-51b2-48b1-ac7a-84f2d6d6c167}  Repository_
  3  2016-11-13 15:59
```

**TIP:**
If you want to recover data from a backup that is stored in another location, for example, a backup created with another instance of Veeam Agent, you can import such backup into the Veeam Agent database on your computer. To learn more, see [Importing Backups](#).
Step 2. Explore Backup Content

For file-level restore, you can use backups of any type:

- Volume-level backups (backups of the entire computer or specific volumes)
- File-level backups

To view detailed information about specific backup, use the following command:

```
veeamconfig backup show --id <backup_id>
```

where:

- `<backup_id>` — ID of the backup for which you want to view detailed information.

For a volume-level backup, Veeam Agent for Linux displays the following information:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Machine name</td>
<td>Host name of the machine on which the backup job is configured and the name of the job.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the volume in the backup.</td>
</tr>
<tr>
<td>Device</td>
<td>Path to the block device that represents the volume.</td>
</tr>
<tr>
<td>FS UUID</td>
<td>File system ID.</td>
</tr>
<tr>
<td>Offset</td>
<td>Position of the volume on the computer disk.</td>
</tr>
<tr>
<td>Size</td>
<td>Size of the volume in the backup.</td>
</tr>
</tbody>
</table>

For a file-level backup, Veeam Agent for Linux displays the following information:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Machine name</td>
<td>Host name of the machine on which the backup job is configured and the name of the job.</td>
</tr>
<tr>
<td>Backed up</td>
<td>Backup scope for the file-level backup job.</td>
</tr>
</tbody>
</table>
For example:

```
user@srv01:~$ veeamconfig backup show --id ea64a7e5-038a-4c86-970a-6d59d4cf3968
  Machine name: srv01 DocumentsBackup
  File-level backup
  Backed up:
      /home/user/Documents
```
Step 3. Mount Backup

To mount a backup for file-level restore, use the following command:

```bash
veeamconfig backup mount --id <backup_id> --mountdir <path>
```

where:

- `<backup_id>` — ID of the backup that you want to mount to the computer file system for file-level restore.
- `<path>` — path to the directory to which you want to mount the backup file content.

For example:

```bash
user@srv01:$ veeamconfig backup mount --id ea64a7e5-038a-4c86-970a-6d59d4cf3968 --mountdir /mnt/backup
Backup is mounted.
Session ID: {2a313184-32d0-4d3a-a1b0-2eebac986047}.
Logs stored in: [/var/log/veeam/Mount/Session_{2a313184-32d0-4d3a-a1b0-2eebac986047}].
```
Step 4. Monitor Mount Process and Result

You can monitor the backup mount process by viewing the mount session log in the command line interface.

To view Veeam Agent session log, use the following command:

```
veeamconfig session log --id <session_id>
```

where:

`<session_id>` — ID of the backup mount session.

For example:

```
user@srv01:~$ veeamconfig session log --id 2a313184-32d0-4d3a-a1b0-2eebac986047
2016-11-22 17:30:34 UTC {30878c82-27d0-45dc-ab21-6f27d5082fd4} [info] Job started at 2016-11-22 20:30:34
2016-11-22 17:30:34 UTC {714b21d0-0d20-486e-b1e5-22d5fb5a8ee9} [info] Mounting restore point
2016-11-22 17:30:35 UTC {d331f038-5b7c-4549-85cf-5e1b54dbaf71} [info] Restore point has been mounted
```

To ensure that the backup is successfully mounted, you can browse to the directory that you specified in the `veeamconfig backup mount` command. For example:

```
user@srv01:~$ ls /mnt/backup/
FileLevelBackup_0
```

**TIP:**

You can also check the restore session status with the `veeamconfig session info` command. To learn more, see Viewing Session Status.
Step 5. Save Restored Files

When the backup file content is mounted to the computer file system, you can use Linux command line utilities or preferred file browser to work with restored files and folders. You can browse for files and folders in the mounted backup and copy files and folders that you want to restore to their initial location or to a new location.

In the following example, the restored file *Report1.pdf* is copied from the mounted backup to a new location with the Linux command line utilities:

```
user@srv01:~$ ls Documents/
Reports
user@srv01:~$ ls /mnt/backup/FileLevelBackup_0/home/user/Documents/Reports/
user@srv01:~$ cp /mnt/backup/FileLevelBackup_0/home/user/Documents/Reports/Report1.pdf Documents/
user@srv01:~$ ls Documents/
Report1.pdf  Reports
```
Step 6. Stop Backup Mount Session

When Veeam Agent mounts a backup for file-level restore, Veeam Agent starts a new backup mount session. After you have finished working with restored files and folders, you can stop the backup mount session to unmount the backup.

To stop the backup mount session, use the following command:

```
veeamconfig session stop --id <session_id>
```

where:

- `<session_id>` — ID of the backup mount session that you want to stop.

Veeam Agent will stop the mount session and unmount the backup from the computer file system. For example:

```
user@srv01:~$ veeamconfig session stop --id 2a313184-32d0-4d3a-a1b0-2eebac986047
Session has stopped.
user@srv01:~$ ls /mnt
user@srv01:~$
```
Restoring from Restore Point

With Veeam Agent command line interface, you can restore files and folders from the specific restore point. When you restore files and folders from the restore point, you can select the necessary restore point in the backup to recover data to a specific point in time.
Step 1. Locate Backup

To view a list of backups created by Veeam Agent, use the following command:

```
veeamconfig backup list --all
```

In the list of backups, Veeam Agent displays information about all Veeam Agent for Linux backups stored in all backup repositories. If Veeam Agent is connected to a Veeam backup server, all Veeam Agent for Linux backups that are kept on Veeam backup repositories managed by this server also appear in this list.

The `--all` parameter is optional. If you do not use this option, Veeam Agent displays information about backups created by the current Veeam Agent computer only.

For each backup, Veeam Agent displays the following information:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job name</td>
<td>Host name of the computer on which the backup job was configured and name of the job by which the backup was created.</td>
</tr>
<tr>
<td>Backup ID</td>
<td>ID of the backup.</td>
</tr>
<tr>
<td>Repository</td>
<td>Name of the backup repository in which the backup was created. Imported backups are marked as <em>Imported</em> in the <em>Repository</em> column. For information about the import procedure, see <em>Importing Backups</em>.</td>
</tr>
<tr>
<td>Created at</td>
<td>Date and time of the backup creation.</td>
</tr>
</tbody>
</table>

For example:

```
user@srv01:~$ veeamconfig backup list --all
Job name                   Backup ID                               Repository
srv01 SystemBackup         {45f074d2-d2d9-423d-84e9-8f1798b08d4c}  Repository_
1  2016-11-11 17:37
srv01 DocumentsBackup      {ea64a7e5-038a-4c86-970a-6d59d4cf3968}  Repository_
1  2016-11-11 18:30
srv01 HomePartitionBackup  {4f75bb20-a6b6-4323-9287-1c6c8cecc6b6}  Repository_
2  2016-11-15 11:28
wrk01 SystemBackup         {95ac571-dd29-45ac-8624-79b8cc645863}  Repository_
2  2016-11-13 15:26
wrk02 SystemBackup         {8d6d4d39-51b2-48b1-ac7a-84f26d6bc167}  Repository_
3  2016-11-13 15:59
```

**TIP:**

If you want to recover data from a backup that is stored in another location, for example, a backup created with another instance of Veeam Agent, you can import such backup into the Veeam Agent database on your computer. To learn more, see *Importing Backups*. 
Step 2. Explore Restore Points

To view information about restore points in the backup, use the following command:

```
veeamconfig backup info --id <backup_id>
```

or

```
veeamconfig point list --backupid <backup_id>
```

where:

<backup_id> — ID of the backup for which you want to view information on restore points.

You can view the following information about restore points in the backup:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Job name</strong></td>
<td>Name of the backup job by which the backup was created.</td>
</tr>
<tr>
<td><strong>OIB ID</strong></td>
<td>ID of the restore point in the backup.</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Type of the restore point. Possible values:</td>
</tr>
<tr>
<td></td>
<td>• Full</td>
</tr>
<tr>
<td></td>
<td>• Increment.</td>
</tr>
<tr>
<td><strong>Created at</strong></td>
<td>Date and time of the restore point creation.</td>
</tr>
<tr>
<td><strong>Is corrupt</strong></td>
<td>Indicates whether restore point in the backup is corrupted. Possible values:</td>
</tr>
<tr>
<td></td>
<td>• True</td>
</tr>
<tr>
<td></td>
<td>• False.</td>
</tr>
</tbody>
</table>
For example:

```bash
user@srv01:~$ veeamconfig backup info --id ea64a7e5-038a-4c86-970a-6d59d4cf3968
Job name               OIB ID                                  Type       Created at        Is corrupt
srv01 DocumentsBackup  {0f3c9f3e-3985-4dc9-8cd6-979dba810c2f}  Full       2016-11-11 18:31    false
srv01 DocumentsBackup  {ff0c6969-8b9b-4865-b4f9-d686faf41d50}  Increment 2016-11-14 13:35    false
srv01 DocumentsBackup  {a9e420df-d749-4b9a-b675-19d8e943bf1}  Increment 2016-11-14 13:43    false
srv01 DocumentsBackup  {51e6056b-c0ae-40bc-bcf4-4ad7339f647a}  Increment 2016-11-14 15:48    false
srv01 DocumentsBackup  {b127e64e-1f1c-4e0b-bb36-b087761267b3}  Increment 2016-11-20 19:52    false
```

or

```bash
user@srv01:~$ veeamconfig point list --backupid ea64a7e5-038a-4c86-970a-6d59d4cf3968
Job name               OIB ID                                  Type       Created at        Is corrupt
srv01 DocumentsBackup  {0f3c9f3e-3985-4dc9-8cd6-979dba810c2f}  Full       2016-11-11 18:31    false
srv01 DocumentsBackup  {ff0c6969-8b9b-4865-b4f9-d686faf41d50}  Increment 2016-11-14 13:35    false
srv01 DocumentsBackup  {a9e420df-d749-4b9a-b675-19d8e943bf1}  Increment 2016-11-14 13:43    false
srv01 DocumentsBackup  {51e6056b-c0ae-40bc-bcf4-4ad7339f647a}  Increment 2016-11-14 15:48    false
srv01 DocumentsBackup  {b127e64e-1f1c-4e0b-bb36-b087761267b3}  Increment 2016-11-20 19:52    false
```
Step 3. Mount Restore Point

To mount a backup for file-level restore, use the following command:

```
veeamconfig point mount --id <point_id> --mountdir <path>
```

where:

- `<point_id>` — ID of the restore point that you want to mount to the computer file system for file-level restore.
- `<path>` — path to the directory to which you want to mount the backup file content.

For example:

```
user@srv01:~$ veeamconfig point mount --id b127e64e-1f1c-4e0b-bb36-b087761267b3 --mountdir /mnt/backup
Restore point is mounted.
Session ID: [4d69dd85-ac60-4cff-883d-50f25f49a9c8].
Logs stored in: [/var/log/veeam/Mount/Session_{4d69dd85-ac60-4cff-883d-50f25f49a9c8}].
```
Step 4. Monitor Mount Process and Result

You can monitor the restore point mount process by viewing the mount session log in the command line interface.

To view Veeam Agent session log, use the following command:

```
veeamconfig session log --id <session_id>
```

where:

`<session_id>` — ID of the restore point mount session.

For example:

```
user@srv01:~$ veeamconfig session log --id 4d69dd85-ac60-4cfe-883d-50f25f49a9c8
2016-11-23 12:44:55 UTC {4ac10045-a74b-4a41-9c5e-53521cbe1045} [info] Mounting restore point
2016-11-23 12:44:56 UTC {540a61f7-5d5c-47d5-a2b8-51da694d5ec} [info] Restore point has been mounted
```

To ensure that the restore point is successfully mounted, you can browse to the directory that you specified in the `veeamconfig point mount` command. For example:

```
user@srv01:~$ ls /mnt/backup/
FileLevelBackup_0
```

**TIP:**
You can also check the restore session status with the `veeamconfig session info` command. To learn more, see Viewing Session Status.
Step 5. Save Restored Files

When the restore point is mounted to the computer file system, you can use Linux command line utilities or preferred file browser to work with restored files and folders. You can browse for files and folders in the mounted backup and copy files and folders that you want to restore to their initial location or to a new location.

In the following example, the restored file Report1.pdf is copied from the mounted restore point to a new location with the Linux command line utilities:

```
user@srv01:~$ ls Documents/
Reports
user@srv01:~$ ls /mnt/backup/FileLevelBackup_0/home/user/Documents/Reports/
user@srv01:~$ cp /mnt/backup/FileLevelBackup_0/home/user/Documents/Reports/Report1.pdf Documents/
user@srv01:~$ ls Documents/
Report1.pdf Reports
```
Step 6. Stop Backup Mount Session

When Veeam Agent mounts a restore point for file-level restore, Veeam Agent starts a new restore point mount session. After you have finished working with restored files and folders, you can stop the mount session to unmount the restore point.

To stop the restore point mount session, use the following command:

```
veeamconfig session stop --id <session_id>
```

where:

- `<session_id>` — ID of the restore point mount session that you want to stop.

Veeam Agent will stop the mount session and unmount the restore point from the computer file system. For example:

```
user@srv01:~$ veeamconfig session stop --id 4d69dd85-ac60-4cfc-883d-50f25f49a9c8
Session has stopped.
user@srv01:~$ ls /mnt
user@srv01:~$
```
Exporting Backup to Virtual Disk

You can export a backup to a virtual disk in the VHD format. You can then attach the created VHD disc to a virtual machine to recover your computer in a virtual environment.

- Exporting Backups
- Exporting Restore Points
Exporting Backups

You can export the backup file to a virtual disk in the VHD format. When you export a backup, you export to a virtual disk data pertaining to the latest restore point in the backup. The created VHD disk will reflect the state in which backed-up volumes were at the time when the latest restore point was created.

To export backup to a VHD disk:

1. Start the export process with the following command:

   ```
   veeamconfig backup export --id <backup_id> --outdir <path>
   ```

   where:
   - `<backup_id>` — ID of the backup that you want to export to a virtual disk.
   - `<path>` — full path to a directory in which you want to save the created virtual disk. Specifying relative paths is not supported.

   For example:

   ```
   user@srv01:~$ veeamconfig backup export --id 45f074d2-d2d9-423d-84e9-8f1798b08d4c --outdir /home/user/disk
   Export has been started.
   Session ID: [(5f001367-8937-46e0-a756-449bf9f1a182)].
   Logs stored in: [/var/log/veeam/Export/Session_{5f001367-8937-46e0-a756-449bf9f1a182}].
   ```

2. You can monitor the export process and result by viewing the export session log with the following command:

   ```
   veeamconfig session log --id <session_id>
   ```

   where:
   - `<session_id>` — ID of the export session.

   For example:

   ```
   user@srv01:~$ veeamconfig session log --id 5f001367-8937-46e0-a756-449bf9f1a182
   2016-11-27 11:20:56 UTC {b54af37c-35a6-4807-80d2-0f070f024e69} [info] Job started at 2016-11-27 14:20:56
   2016-11-27 11:20:56 UTC {48d699d2-86cf-4a32-b9c8-ab51b8325f3c} [info] Exporting virtual disks content
   2016-11-27 11:20:57 UTC {0e2e7d97-f067-4823-8dde-084c401eb62b} [info] Device [30460cb5].
   2016-11-27 11:22:59 UTC {0e2e7d97-f067-4823-8dde-084c401eb62b} [info] Device [30460cb5] has been exported
   2016-11-27 11:23:00 UTC {3ef0d0c5-2af7-48d8-abc2-c8ef9aaffc54} [info] Virtual disks content has been exported
   ```

You can also check the restore session status with the `veeamconfig session info` command. To learn more, see Viewing Session Status.
3. Exported backup will be saved as a virtual disk file in the specified directory. You can check this with a file browser or with the following command:

```
ls <path>
```

where:

* `<path>` — path to the directory in which the virtual disk with the backup is saved.

For example:

```
user@srv01:~$ ls disk/
dev_30460cb5.vhd
```
Exporting Restore Points

You can export the specific restore point to a virtual disk in VHD format. When you export a restore point, you select the necessary restore point in the backup to recover data to a desired point in time. The created VHD disk will reflect the state in which backed-up volumes were at the time when the selected restore point was created.

To export restore point to a VHD disk:

1. Start the export process with the following command:

   ```bash
   veeamconfig point export --id <point_id> --outdir <path>
   ```

   where:
   - `<point_id>` — ID of the restore point that you want to export to a virtual disk.
   - `<path>` — full path to a directory in which you want to save the created virtual disk. Specifying relative paths is not supported.

   For example:

   ```bash
   user@srv01:~$ veeamconfig point export --id b319e1f-59a2-41ea-9ca3-b660e86ac941 --outdir /home/user/veeam/
   Export has been started.
   Session ID: [aeb9c549-a660-4a0e-b89c-cb076b8bfa85].
   Logs stored in: [/var/log/veeam/Export/Session_{aeb9c549-a660-4a0e-b89c-cb076b8bfa85}].
   ```

2. You can monitor the export process and result by viewing the export session log with the following command:

   ```bash
   veeamconfig session log --id <session_id>
   ```

   where:
   - `<session_id>` — ID of the export session.

   For example:

   ```bash
   user@srv01:~$ veeamconfig session log --id aeb9c549-a660-4a0e-b89c-cb076b8bfa85
   2016-05-05 11:15:21 UTC {32d56391-9002-431e-ae6b-2285537a67e5} [info] Exporting virtual disks content
   2016-05-05 11:15:22 UTC {ba3dabe0-0556-430c-9671-9448a6dc4bcb} [processing ] Restoring device: [30460cb5].
   2016-05-05 11:17:26 UTC {ba3dabe0-0556-430c-9671-9448a6dc4bcb} [info] Device [30460cb5] has been exported
   2016-05-05 11:17:26 UTC {9e945c29-900e-4a07-9e3b-ccf7f156807d} [info] Virtual disks content has been exported
   ```

You can also check the restore session status with the `veeamconfig session info` command. To learn more, see Viewing Session Status.
3. Exported backup will be saved as a virtual disk file in the specified directory. You can check this with a file browser or with the following command:

```
ls <path>
```

where

<path> — path to the directory in which the virtual disk with the backup is saved.

For example:

```
user@srv01:~$ ls /home/user/veeam/
    dev_30460cb5.vhd
```
Restoring Data from Encrypted Backups

When you restore data from an encrypted backup, Veeam Agent performs data decryption automatically in the background or requires you to specify a password.

- If encryption keys required to unlock the backup file are available in the Veeam Agent database, that is, if you encrypt and decrypt the backup file on the same Veeam Agent computer, you do not need to specify the password. Veeam Agent uses keys from the database to unlock the backup file. Data decryption is performed in the background, and data restore from the encrypted backup does not differ from that from an unencrypted one.

- If encryption keys are not available in the Veeam Agent database, you need to provide a password to unlock the encrypted file. The password must be the same as the password that was used to encrypt the backup file. If the password has changed once or several times, you need to specify the latest password. In Veeam Agent, you can use the latest password to restore data from all restore points in the backup chain, including restore points that were encrypted with an old password and restore points that were created before you have enabled the encryption option for the job.

The process of unlocking an encrypted backup file differs depending on what Veeam Agent user interface you use for data restore.

- Veeam Agent graphical user interface
- Veeam Agent command line interface

Restoring Data from Encrypted Backups Using GUI

To restore data from an encrypted backup using the Veeam Agent graphical user interface:

1. Launch the necessary data restore wizard:
   - If you want to perform file-level restore from an encrypted backup that was created on another Veeam Agent computer, launch the Veeam Agent control panel with the `veeam` or `veeamconfig ui` command. To learn more, see Restoring Files and Folders.
   - If you want to perform volume-level restore or file-level restore recovery from an encrypted backup, boot from the Veeam Recovery Media and launch the necessary data restore wizard. To learn more, see Restoring from Veeam Recovery Media.

2. Follow the steps of the wizard to specify where the encrypted backup file that you plan to use for restore resides. If the backup file resides in a remote location, select the backup location type and specify settings to connect to the backup location.
3. Select the encrypted backup and restore point from which you want to restore data.

4. Veeam Agent will display the Encryption window. Enter the password for the backup file.

   In the Hint field of the Encryption window, Veeam Agent displays a hint for the password that was used to encrypt the backup file. Use the hint to recall the password.

   If you changed the password one or several times while the backup chain was created, you need to specify the latest password. In Veeam Agent, you can use the latest password to restore data form all restore points in the backup chain, including those restore points that were encrypted with an old password.
If you enter correct password, Veeam Agent will decrypt the backup metadata. You will be able to continue the restore operation in a regular manner.

Restoring Data from Encrypted Backups Using Command Line Interface

To restore data from an encrypted backup using the Veeam Agent command line interface, complete the following steps:

1. Import the encrypted backup file to the Veeam Agent database. To learn more, see Importing Encrypted Backups.

2. Perform the necessary restore operation in a regular manner. To learn more, see Restoring Volumes with Command Line Interface and Restoring Files and Folders with Command Line Interface.
Reporting

Veeam Agent for Linux provides several ways to get information about performed operations:

- With the Veeam Agent control panel
- With the Veeam Agent command line interface

For every data transfer operation, for example data backup and restore, backup import and export, Veeam Agent starts a new session. You can monitor performance of sessions started by Veeam Agent in the following ways:

- Monitor backup job session progress with the control panel.
- View real-time backup job session statistics with the control panel.
- View backup job sessions results with the control panel.
- View the session status using the command line interface.
- View session logs.
Viewing Job Session Progress

You can monitor the backup job session progress in the list of sessions in the Veeam Agent control panel. For the currently running backup job session, Veeam Agent shows session status and percentage of session completion in the **State** column of the list of sessions.

To view backup job session progress, do the following:

1. If you have started the backup job from the command line, launch the Veeam Agent control panel with the `veeam` command.

2. In the Veeam Agent control panel, in the list of backup job sessions, monitor progress of the currently running session.

   If you have started the backup job from the Veeam Agent control panel, Veeam Agent will immediately display the list of backup job sessions with the currently running session.

**TIP:**

You can stop the backup job session at any time. To stop the backup job session, press the 's' key.
Viewing Real-Time Job Session Statistics

You can view real-time statistics for a job session in the Veeam Agent control panel. Veeam Agent shows detailed data for every backup job session: job progress, duration, processing rate, performance bottlenecks, amount of processed data, read and transferred data and details of the session performance, for example, warnings and errors that have occurred in the process of operation.

To view detailed information on the currently running backup job session, do the following:

1. If you have started the backup job from the command line, launch the Veeam Agent control panel with the `veeam` command.

2. In the Veeam Agent control panel, in the list of backup job sessions, select the currently running session with Up and Down keys and press Enter.

   If you have started the backup job from the Veeam Agent control panel, the current session will be already selected in the list of backup job sessions.

   **TIP:**
   You can stop the backup job session at any time. To stop the backup job session, press the 's' keyboard key.

Statistics Counters

Veeam Agent for Linux displays jobs statistics for the following counters:

- The pane at the top of the control panel shows information on the job session type, percentage of the job completion and session status. If Veeam Agent operates in the Server edition and you have created more than one backup job, the job name also appears on the pane.

- The **Summary** box shows general information about the job:
  - **Duration** — time from the job start till the job end.
  - **Processing rate** — average speed of data processing. This counter is a ratio between the amount of processed data (`Processed` counter) and job duration (`Duration` counter).
  - **Bottleneck** — bottleneck in the data transmission process.

- The **Data** box shows information about processed data:
  - **Processed** — total size of all volumes processed by the job.
  - **Read** — amount of data read from the backed-up volume by Veeam Agent for Linux prior to applying compression. For incremental job runs, the value of this counter is typically lower than the value of the `Processed` counter. Veeam Agent reads only data blocks that have changed since the last job session, processes and copies these data blocks to the target location.
  - **Transferred** — amount of data transferred from the backed-up volume to the backup location after applying compression. This counter does not directly indicate the size of the resulting files. Depending on the backup infrastructure and job settings, Veeam Agent can perform additional activities with data, for example, decompress data prior to writing the file to disk. The activities can impact the size of the resulting file.

- The box in the center of the control panel shows a list of operations performed during the job session, their start time and duration time. To scroll the list of operations, use Up and Down arrow keys on the keyboard.
The pane at the lower side of the control panel shows help information on how to navigate the control panel.
Viewing Job Session Result

You can view detailed statistics on every backup job session performed by Veeam Agent for Linux.

To view statistics for a specific job session:

1. Open the Veeam Agent control panel with one of the following commands:

   veeam

   or

   veeamconfig ui

   or

   veeamconfig session ui

2. In the Latest backup sessions list, select the necessary backup job session with Up and Down keys and press Enter.
TIP:

To return to the list of backup job sessions, press **Esc**. You can then select another backup job session or exit the Veeam Agent control panel in one of the following ways:

- with the **Esc** key — if you opened the control panel with the `veeam` or `veeamconfig ui` command.
- with the ‘q’ key — if you opened the control panel with the `veeamconfig session ui` command.

Viewing Session Status

You can view status of every session that was started by Veeam Agent for Linux. To view the session status, use the following command:

```
veeamconfig session info --id <session_id>
```

where:

`<session_id>` — ID of the session for which you want to check status.

Veeam Agent displays the following information about sessions:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>ID of the session.</td>
</tr>
<tr>
<td>Job name</td>
<td>Name of the backup job parent to the session. Veeam Agent displays value for this parameter only for backup job sessions.</td>
</tr>
<tr>
<td>Job ID</td>
<td>ID of the backup job parent to the session. Veeam Agent displays value for this parameter only for backup job sessions.</td>
</tr>
<tr>
<td>State</td>
<td>Current status of the session.</td>
</tr>
<tr>
<td>Start time</td>
<td>Date and time of the session start.</td>
</tr>
<tr>
<td>End time</td>
<td>Date and time of the session completion. Veeam Agent displays value for this parameter only for completed sessions.</td>
</tr>
</tbody>
</table>

The following example shows status information on the completed backup job session:

```
user@srv01:~$ veeamconfig session info --id 1592755d-3a2b-40a9-a036-5c81853b369e
Backup session
  ID: {1592755d-3a2b-40a9-a036-5c81853b369e}
  Job name: SystemBackup
  Job ID: {2495911e-58db-4452-b4d1-f53dfbc600e}
  State: Success
  Start time: 2016-11-11 14:37:21 UTC
  End time: 2016-11-11 14:40:02 UTC
```
The following example shows status information on the running volume restore session:

```
user@srv01:~$ veeamconfig session info --id 697d9348-9001-4845-8764-3cc4fb3f296b
Restore session
  ID: {697d9348-9001-4845-8764-3cc4fb3f296b}
  State: Running
  Start time: 2016-11-27 10:35:47 UTC
  End time:
```
Viewing Session Logs

You can monitor the backup and restore process by viewing the backup job session and restore session logs in the Veeam Agent command line interface.

To view Veeam Agent session log, use the following command:

```
veeamconfig session log --id <session_id>
```

where:

`<session_id>` — ID of the backup job or restore session.

For example:

```
user@srv01-$ veeamconfig session log --id 0b72ef45-4c88-4639-b940-ad3828b1cd4e
2016-11-27 11:04:04 UTC {b141f32a-3e77-45a6-b55a-c100a1464d67} [info] Job started

```
Managing Configuration Database

You can perform the following operations with the Veeam Agent configuration database:

- Export configuration database to a configuration file.
- Import configuration database to `<i%VA%>`.
Exporting Configuration Database

You can export the Veeam Agent configuration database to a configuration file in the XML format. This may be useful, for example, if you want to change Veeam Agent settings by editing a configuration file or copy the Veeam Agent configuration to another computer.

To export the Veeam Agent configuration database, use the following command:

```
veeamconfig config export --file <path>
```

where:

`<path>` — path to a configuration file to which you want to export the configuration database.

For example:

```
user@srv01:~$ veeamconfig config export --file veeam/config.xml
```

**NOTE:**

A directory in which you want to save the configuration file must exist in the file system.
Importing Configuration Database

You import the Veeam Agent configuration from a file in the XML format to the configuration database. This may be useful, for example, if you have changed Veeam Agent for Linux settings by editing a configuration file or want to apply configuration of another instance of Veeam Agent to Veeam Agent installed on your computer.

**NOTE:**

Veeam Agent for Linux 5.0 does not support import of XML configuration files generated by earlier versions of Veeam Agent.

To import the Veeam Agent configuration database, use the following command:

```
veeamconfig config import --file <path>
```

where:

- `<path>` — path to a configuration file from which you want to import the configuration database.

For example:

```
user@srv01:~$ veeamconfig config import --file veeam/config.xml
```
Exporting Product Logs

Veeam Agent offers a simple and convenient way to collect product logs and export them to an archive file. This operation may be required if you want to report an issue and need to attach log files to the support case.

When you export logs, Veeam Agent collects its log files and configuration files, exports them to an archive file in the `tar.gz` format and saves this archive file to a directory on the Veeam Agent computer.

You can perform the export logs operation in one of the following ways:

- **With the Veeam Agent control panel** — in this case, you can specify a directory to which Veeam Agent should save the log archive.
- **With the command line interface** — in this case, Veeam Agent will save the log archive to the current working directory.

**TIP:**

When you perform restore operations after booting from the Veeam Recovery Media, Veeam Agent also saves restore logs to the backup location. Restore logs are saved to an archive file with the name `veeam_logs_<date>_<time>.tar.gz`. The archive is placed to the folder that contains the backup file from which you restored data.

If you encounter problems after restoring from the Veeam Recovery Media, it is recommended that you attach restore logs, as well as product logs collected by Veeam Agent, to the support case.
Exporting Logs with Control Panel

You can use the Veeam Agent control panel to collect and export product logs. When you export logs with the control panel, you can choose where Veeam Agent should save the resulting log archive.

To export logs:

1. Launch the Veeam Agent control panel with the `veeam` or `veeamconfig ui` command.
2. In the Veeam Agent control panel, press the 'm' key to open the Miscellaneous menu.
3. In the menu, select the Export Logs option and press Enter.
4. In the Choose logs directory window, specify a directory to which you want to save the log archive:
   a. In the Choose logs directory window, select the necessary directory and press Enter.
   b. Repeat the step 'a' until a path to the directory in which you want to save exported logs appears in the Current directory field.
   c. To create a new directory, switch to the Create Dir button, press Enter, then type a name for the new directory and press Enter.
d. Switch to the **Ok** button and press **Enter**. Veeam Agent will collect logs, export them to an archive file with the name `veeam_logs_<date>_time.tar.gz`, and save the archive to the specified directory.
Exporting Logs with Command Line Interface

You can use the Veeam Agent command line interface to collect and export product logs. To export logs, use the following command:

```
veeamconfig grablogs
```

Veeam Agent will collect logs, export them to an archive file with the name `veeam_logs_<date>_<time>.tar.gz`, and save the archive to the current working directory.

For example:

```
user@srv01:~$ veeamconfig grablogs
Logs have been exported successfully.
```
Getting Support

If you have any questions or want to share your feedback about Veeam Agent, you can use one of the following options:

- You can search for the information on the necessary subject in the current Veeam Agent for Linux User Guide.
- You can visit Veeam R&D Forums and share your opinion or ask a question.
- If you use Veeam Agent with an active license installed, you can visit Veeam Customer Support Portal and submit a support case to the Veeam Customer Support Team.
Using with Veeam Backup & Replication

If you have the Veeam backup infrastructure deployed in the production environment, you can use Veeam Agent for Linux together with Veeam Backup & Replication.

**IMPORTANT!**

If you plan to use Veeam Agent for Linux 5.0 with Veeam Backup & Replication, you must install Veeam Backup & Replication 11 on the Veeam backup server. Veeam Agent for Linux 4.0 or later supports integration with Veeam Backup & Replication 11 or later as well.

**NOTE:**

The subsequent sections describe tasks available for Veeam Agent operating in the standalone mode. For information about Veeam Agent management in Veeam Backup & Replication, see Veeam Agent Management Guide.

Tasks with Veeam Backup & Replication

Veeam Backup & Replication lets you perform a number of additional disaster recovery tasks and administrative actions with Veeam Agent backups. You can:

**Data protection tasks**

- Create Veeam Agent backups on backup repositories
- Create Veeam Agent backups on a Veeam Cloud Connect repository
- Copy Veeam Agent backups to secondary backup repositories
- Archive Veeam Agent backups to tape

**Restore tasks**

- Restore a Veeam Agent backup to a VMware vSphere VM
- Restore a Veeam Agent Backup to a Microsoft Hyper-V VM
- Restore files and folders from Veeam Agent backups
- Restore application items from Veeam Agent backups with Veeam Explorer for Oracle
- Restore disks from Veeam Agent backups
- Export Veeam Agent backups to standalone full backup files
- Restore data from Veeam Agent backups to Microsoft Azure
- Restore data from Veeam Agent backups to Amazon EC2

**Administrative tasks**

- Import Veeam Agent backups
- Enable and disable Veeam Agent backup jobs
- View Veeam Agent backup job statistics
- Delete Veeam Agent backup jobs
- Remove Veeam Agent backups
- View Veeam Agent backup statistics
- Configure global settings
- Assign roles to users
Setting Up User Permissions on Backup Repositories

To be able to store backups on a backup repository managed by a Veeam backup server, the user must have access permissions on this backup repository.

**NOTE:**

If you plan to create backups on a Veeam backup repository with Veeam Agent backup jobs configured in Veeam Backup & Replication, you do not need to grant access permissions on the backup repository to users. In the Veeam Agent management scenario, to establish a connection between the backup server and protected computers, Veeam Backup & Replication uses a TLS certificate. To learn more, see the Configuring Security Settings section in the Veeam Agent Management Guide.

Access permissions are granted to security principals such as users and AD groups by the backup administrator working with Veeam Backup & Replication. Users with granted access permissions can target Veeam Agent backup jobs at this backup repository and perform restore from backups located on this backup repository.

Right after installation, access permissions on the default backup repository are set to *Allow to everyone* for testing and evaluation purposes. If necessary, you can change these settings.

After you create a new backup repository, access permissions on this repository are set to *Deny to everyone*. To allow users to store backups on the backup repository, you must grant users with access permissions to this repository.

To grant access permissions to a security principal:

1. In Veeam Backup & Replication, open the Backup Infrastructure view.
2. In the inventory pane, click one of the following nodes:
   - The Backup Repositories node — if you want to grant access permissions on a regular backup repository to Veeam Agent users.
   - The Scale-out Repositories node — if you want to grant access permissions on a scale-out backup repository to Veeam Agent users.
3. In the working area, select the necessary backup repository and click **Set Access Permissions** on the ribbon or right-click the backup repository and select **Access permissions**. If you do not see the **Set Access Permissions** button on the ribbon or the **Access permissions** command is not available in the shortcut menu, press and hold the **Ctrl** key, right-click the backup repository and select **Access permissions**.

4. In the **Access Permissions** window, specify to whom you want to grant access permissions on this backup repository:
   - **Allow to everyone** — select this option if you want all users to be able to store backups on this backup repository. Setting access permissions to *Everyone* is equal to granting access rights to the *Everyone* Microsoft Windows group (*Anonymous* users are excluded). Note, however, this scenario is recommended for demo environments only.
   - **Allow to the following accounts or groups only** — select this option if you want only specific users to be able to store backups on this backup repository. Click **Add** to add the necessary users and groups to the list.
5. If you want to encrypt Veeam Agent backup files stored on the backup repository, select the **Encrypt backups stored in this repository** check box and choose the necessary password from the field below. If you have not specified a password beforehand, click **Add** on the right or the **Manage passwords** link to add a new password. Veeam Backup & Replication will encrypt files on the backup repository side using its built-in encryption mechanism. To learn more, see [Veeam Backup & Replication Documentation](#).
Managing License

If you plan to use Veeam Agent for Linux with Veeam Backup & Replication, you must have a license installed in Veeam Backup & Replication. The license must have a total number of instances that is sufficient to protect Linux-based machines (servers and workstations) on which you plan to install Veeam Agent. The number of backup jobs configured in Veeam Agent does not consume the license. To learn more about per-instance licensing in Veeam Backup & Replication, see the Licensed Objects section in the Veeam Backup & Replication User Guide.

After Veeam Agent for Linux connects to Veeam Backup & Replication, Veeam Agent automatically starts consuming the license. By default, Veeam Agent operates in the Server edition. You can switch Veeam Agent to the Workstation edition manually if needed.

If one or more Veeam Agents operating in the Free edition are already connected to the backup server, they will start consuming the license immediately after the license is installed in Veeam Backup & Replication. Veeam Agents that exceed the license limit will not be able to back up data to the Veeam backup repository.

Veeam Agent keeps information about the license in its database. Information about the license is valid for 32 days. If Veeam Agent for Linux does not connect to Veeam Backup & Replication during this period, Veeam Backup & Replication will revoke its license.
Managing Instance Consumption by Veeam Agents

By default, Veeam Backup & Replication allows Veeam Agents to connect to the Veeam backup server and consume instances in the license. If you do not want Veeam Agents to consume instances, you can restrict instance consumption. After instance consumption is restricted, Veeam Agents will not be able to back up data to a Veeam backup repository.

To restrict instance consumption by Veeam Agents:

1. In Veeam Backup & Replication, from the main menu, select License.
2. In the License Information window, click the Instances tab.
3. On the Instances tab, clear the Allow unlicensed agents to consume instances check box.
4. Click Close.
Assigning License to Veeam Agent

After Veeam Agent connects to Veeam Backup & Replication, Veeam Agent automatically starts consuming the license. If the license allows Veeam Agent to operate in both the Workstation Server editions, Veeam Agent will operate in the Server edition.

You can also assign a license to Veeam Agent manually if needed. When you assign a license, you can select in which edition the licensed Veeam Agent will operate.

To assign a license:

1. In Veeam Backup & Replication, from the main menu, select **License**.
2. In the **License Information** window, select the **Instances** tab and click **Manage**.
3. In the **Licensed Instances** window, select the Veeam Agent to which you want to assign the license, click **Assign** and select the desired edition: **Workstation** or **Server**.
Viewing Licensed Agents and Revoking License

When Veeam Backup & Replication connects to the backup server, Veeam Backup & Replication applies a license to the Veeam Agent. You can view to which Veeam Agents the license is currently applied.

To view a list of licensed Veeam Agents:

1. In Veeam Backup & Replication, from the main menu, select License.
2. In the License Information window, select the Instances tab and click Manage.

In the list of licensed instances, Veeam Backup & Replication displays Veeam Agents that have established a connection with the backup server during a Veeam Agent backup job session.

Revoking License from Veeam Agents

You can revoke the license from some Veeam Agents and re-apply it to other protected workloads. License revoking can be helpful, for example, if you do not want to use some Veeam Agents with Veeam Backup & Replication anymore.

To revoke a license from the Veeam Agent:

1. In Veeam Backup & Replication, from the main menu, select License.
2. In the License Information window, select the Instances tab and click Manage.
3. In the Licensed Instances window, select the Veeam Agent from which you want to revoke the license and click Revoke. Veeam Backup & Replication will revoke the license from the Veeam Agent, and the license will be freed for other workloads protected with Veeam Backup & Replication.
The Veeam Agent from which you have revoked the license will become unable to connect to the Veeam backup server but will remain in the **Licensed Instances** list. To allow this Veeam Agent to create backups in the Veeam backup repository, select the Veeam Agent and click **Remove**. During the next backup job session, the Veeam Agent will connect to the Veeam backup server and start consuming the license.
Performing Data Protection Tasks

You can perform the following data protection tasks:

- Back up your data and store the resulting backup files on a backup repository managed by a Veeam backup server.
- Back up your data and store the resulting backup files on a Veeam Cloud Connect Repository.
- Copy Veeam Agent for Linux backups from the backup repository to a secondary backup repository with backup copy jobs.
- Archive Veeam Agent for Linux backups to tapes with backup to tape jobs.
Backing Up to Backup Repositories

You can store backups created with Veeam Agent on backup repositories connected to Veeam backup servers. To do this, you must perform the following actions:

1. **Set up user permissions at the backup repository side.**
2. **Point the Veeam Agent for Linux backup job to the backup repository.**

**NOTE:**

Consider the following:

- A Veeam Agent backup job can be started automatically upon the defined schedule or manually from the Veeam Agent computer. You cannot start, stop, retry or edit Veeam Agent backup jobs in the Veeam Backup & Replication console.
- If the user is granted restore permissions on the Veeam backup server, the user will be able to see all backups on the backup repository.
- The user who creates a Veeam Agent backup on the backup repository is set as the owner of the backup file. The backup file owner can access this file and restore data from it. If the user who is not the backup file owner needs to perform operations with the backup file, the user must have the Veeam Backup & Replication role that allows to perform these operations. To learn more about roles, see the **Roles and Users** section in the Veeam Backup & Replication User Guide.

Backup jobs targeted at the backup repository become visible in Veeam Backup & Replication under the **Jobs > Backup** node in the **Home** view. Backups created with Veeam Agent are available under the **Backups > Disk** node in the **Home** view.

The Veeam Backup Administrator working with Veeam Backup & Replication can manage Veeam Agent backup jobs and restore data from these backups. To learn more, see **Performing Restore Tasks** and **Performing Administration Tasks**.
Backing Up to Cloud Repositories

You can use Veeam Agent to create backups on cloud repositories provided to you by a Veeam Cloud Connect service provider. To do this, you must connect to the service provider and point the backup job to the cloud repository. To connect to the service provider, you can use credentials of the tenant or subtenant account that your provider or backup administrator communicated to you. To learn more, see Veeam Cloud Connect Repository Settings.

Veeam Agent Backups on Tenant Side

Backups created with Veeam Agent are available under the Backups > Cloud node in the Home view of the Veeam Backup & Replication console deployed on the tenant side.

The backup administrator working with Veeam Backup & Replication on the tenant side can manage Veeam Agent backups created on the cloud repository and restore data from such backups. To recover data from a Veeam Agent for Linux backup, you can export disks of the Veeam Agent computer as virtual disks. To learn more, see Exporting Disks.

Veeam Agent Backups on Service Provider Side

The service provider can view information about backup and restore sessions performed by Veeam Agent users within the last 24 hours period. The list of sessions is available under the Last 24 Hours node in the Cloud Connect view of the Veeam Backup & Replication console deployed on the service provider side.
The service provider cannot perform restore tasks with Veeam Agent backups that are stored on the cloud repository.
Performing Backup Copy for Veeam Agent Backups

You can configure backup copy jobs that will copy backups created with Veeam Agent to a secondary backup repository.

Backup copy jobs treat Veeam Agent backups as usual backup files. The backup copy job setup and processing procedures practically do not differ from the same procedures for a backup copy job that processes VM backups. To learn more about backup copy jobs, see the Backup Copy section in the Veeam Backup & Replication User Guide.

Mind the following:

- You can process backups created by Veeam Agent only with backup copy jobs for Linux machine backups. You cannot add a Veeam Agent backup as an additional source of a backup copy job that processes VM backups.
- You can process backups created by Veeam Agent operating in the standalone mode only with backup copy jobs operating in the periodic copy mode. Immediate copy mode is not supported.
- You can process backups created by Veeam Agent operating in the managed mode with backup copy jobs operating in the periodic and immediate copy modes.
  
  Mind that for immediate copy mode, only Veeam Agent backups created by jobs managed by the backup server are supported.
- When mapping a backup copy job to a Veeam Agent backup, consider the limitations listed in the Backup File Mapping section in the Veeam Backup & Replication User Guide.
Restoring Data from Copies of Veeam Agent Backups

Backups copied to the secondary backup repository do not preserve user access permissions. At the same time, users who created backups do not have access permissions on these secondary repositories. For this reason, users cannot restore data from their backups residing in the secondary site.

To overcome this limitation, you can delegate the restore task to backup administrators who work with Veeam Backup & Replication. Backup administrators can use Veeam Backup & Replication to export data contained in backup files as virtual disks.
Archiving Veeam Agent Backups to Tape

You can configure backup to tape jobs to archive Veeam Agent backups to tape.

Backup to tape jobs treat Veeam Agent backups as usual backup files. The archiving job setup and processing procedures practically do not differ from the regular ones. To learn more about backup to tape jobs, see Veeam Backup & Replication Documentation.

**NOTE:**

Keep in mind that in backup to tape job schedule, you cannot select the After this job option for a Veeam Agent job configured directly on a Veeam Agent computer.
Performing Restore Tasks

You can perform the following restore operations:

- Restore a Veeam Agent backup to a VMware vSphere VM
- Restore a Veeam Agent Backup to a Microsoft Hyper-V VM
- Restore individual files and folders from Veeam Agent for Linux backups.
- Restore application items from Veeam Agent backups with Veeam Explorer for Oracle.
- Export computer disks as VMDK, VHD or VHDX disks.
- Export restore points of Veeam Agent backups to standalone full backup files.
- Restore data from Veeam Agent backups to Microsoft Azure.
- Restore data from Veeam Agent backups to Amazon EC2.
Restoring Veeam Agent Backup to VMware vSphere VM

You can use the Veeam Backup & Replication console to restore a Veeam Agent computer as a VMware vSphere VM in your virtualization environment. For instant recovery to a VMware vSphere VM, you can use Veeam Agent backups created on the Veeam backup repository. You cannot perform this operation with Veeam Agent backups created on the Veeam Cloud Connect repository.

A restored VMware vSphere VM has the same settings as a backed-up Veeam Agent computer. During the restore process, Veeam Backup & Replication retrieves settings of the Veeam Agent computer from the backup and applies them to the target VM. These settings include:

- Amount of RAM
- Number of CPU cores
- Number of network adapters
- Network adapter settings
- BIOS UUID (If you do not want to preserve the backed-up machine UUID for a VMware vSphere VM, you can create a new UUID during the instant VM recovery configuration process.)
- Number of disks and volumes
- Size of volumes

If you restore a Veeam Agent computer to a VMware vSphere VM, consider the following:

- Make sure that the target host has enough resources for a new VM. Otherwise, your VM will reduce the target host performance.
- If you restore a workload to the production network, make sure that the original workload is powered off.
The procedure of instant recovery for a Veeam Agent computer practically does not differ from the same procedure for a VM. The main difference from instant VM recovery is that you do not need to select the recovery mode, because Veeam Agent computers are always restored to a new location. To learn more about instant VM recovery, see the Performing Instant VM Recovery of Workloads to VMware vSphere VMs section in the Veeam Backup & Replication User Guide.
Restoring Veeam Agent Backup to Microsoft Hyper-V VM

You can use the Veeam Backup & Replication console to restore a Veeam Agent computer as a Hyper-V VM in your virtualization environment. For instant recovery to a Hyper-V VM, you can use Veeam Agent backups created on the Veeam backup repository. You cannot perform this operation with Veeam Agent backups created on the Veeam Cloud Connect repository.

A restored Hyper-V VM has the same settings as a backed-up Veeam Agent computer. During the restore process, Veeam Backup & Replication retrieves settings of the Veeam Agent computer from the backup and applies them to the target VM.

The procedure of instant recovery for a Veeam Agent computer practically does not differ from the same procedure for a VM. The main difference from instant VM recovery is that you do not need to select the recovery mode, because Veeam Agent computers are always restored to a new location. To learn more about instant VM recovery, see the **Performing Instant Recovery of Workloads to Hyper-V VMs** section in the Veeam Backup & Replication User Guide.
Restoring Files and Folders

You can restore individual files and folders from Veeam Agent backups.

The procedure of file-level restore from a Veeam Agent backup practically does not differ from the same procedure for a VM backup. To learn more about file-level restore, see Veeam Backup & Replication Documentation.
Restoring Application Items

You can use Veeam Explorer for Oracle to restore application items from backups created with Veeam Agent for Linux.

The procedure of application-item restore from a Veeam Agent backup practically does not differ from the same procedure for a VM backup. To learn more about the application-items restore procedure, see the Veeam Explorer for Oracle section in the Veeam Explorers User Guide.
Exporting Disks

You can restore computer disks from volume-level backups and convert them to disks of the VMDK, VHD or VHDX format.

During disks restore, Veeam Agent creates standard virtual disks that can be used by VMware vSphere and Microsoft Hyper-V VMs.

- When you restore a disk in the VMDK format, Veeam Agent creates a pair of files that make up the VM virtual disk: a descriptor file and file with the virtual disk content.
- When you restore a disk in the VHD/VHDX format, Veeam Agent creates a file of the VHD or VHDX format.

You can save converted disks locally on any server added to the backup infrastructure or place disks on a datastore connected to an ESXi host (for VMDK disk format only). VMDK disks can be restored as thin provision and thick provision disks:

- Disks restored to a datastore are saved in the thin provisioned format.
- Disks restored to a server are saved in the thick provisioned format.

VHD/VHDX disks are always restored as dynamically expanding.

Veeam Agent supports batch disk restore. For example, if you choose to restore 2 computer disks, Veeam Agent will convert them to 2 virtual disks and store these disks in the specified location.

**IMPORTANT!**

Consider the following:

- If the backup from which you restore disks contains a Btrfs storage pool, during the disk restore process Veeam Backup & Replication will create a separate disk and restore the Btrfs pool to this disk.
- If the disk you want to restore contains an LVM volume group, Veeam Agent will restore the original disk and the LVM volume group as 2 separate disks. As a result, required storage space will increase. For example, you restore a machine with 2 disks, and a separate LVM volume group is configured on each of these disks. In this case, Veeam Agent will restore 4 disks. The restored disks will consume storage space equal to the size of 2 original disks and 2 LVM volume groups from these disks.

To restore disks and convert them to the VMDK, VHD or VHDX format, use the Export Disk wizard.
Step 1. Launch Export Disk Wizard

To launch the Export Disk wizard:

1. In Veeam Backup & Replication, open the Home view.

2. In the inventory pane, click Disk under the Backups node. In the working area, expand the Agents node, right-click the necessary backup and select Export disk content as virtual disks. You will pass to the Restore Point step of the wizard.
Step 2. Select Restore Point

At the **Restore Point** step of the wizard, select the necessary restore point from which you want to restore disk. In the list of restore points, Veeam Agent displays all restore points that have been created. Make sure that you select a restore point that relates to a volume-level backup.
Step 3. Select Disks

At the Disks step of the wizard, select check boxes next to those disks that you want to export.
Step 4. Select Destination and Disk Format

At the **Target** step of the wizard, select the destination for disk export and format in which you want to save the resulting virtual disk.

1. From the **Server** list, select a server on which the resulting virtual disks must be saved. If you plan to save the disks in the VMDK format on a datastore, select an ESXi host to which this datastore is connected.

2. In the **Path to folder** field, specify a folder on the server or datastore where the virtual disks must be placed.

3. Select the export format for disks:
   - **VMDK** — select this option if you want to save the resulting virtual disk in the VMware VMDK format.
   - **VHD** — select this option if you want to save resulting virtual disk in the Microsoft Hyper-V VHD format.
   - **VHDX** — select this option if you want to save resulting virtual disk in the Microsoft Hyper-V VHDX format (supported by Microsoft Windows Server 2012 and later).

**NOTE:**

If you have selected to store the resulting virtual disk to a datastore, you will be able to save the virtual disk in the VMDK format only. Other options will be disabled.
Step 5. Specify Restore Reason

At the **Reason** step of the wizard, enter a reason for restoring the computer volume.

**NOTE:**

If you do not want to display the **Restore Reason** step of the wizard in future, select the **Do not show me this page again** check box.
Step 6. Complete Restore Process

At the **Summary** step of the wizard, complete the procedure disk restore procedure.

1. Review details for the disk to be restored.
2. Click **Finish** to start the restore procedure and exit the wizard.
Exporting Restore Point to Full Backup File

You can restore data from a specific restore point in a Veeam Agent backup and export this data to a standalone full backup file. The procedure of Veeam Agent backup export does not differ from the same procedure for a VM. To learn more, see the Exporting Backups section in the Veeam Backup & Replication User Guide.
Restoring to Microsoft Azure

You can restore Linux machines from Veeam Agent backups to Microsoft Azure. Backups must be created at the entire machine level or volume level.

The procedure of restore to Microsoft Azure from a Veeam Agent backup practically is similar to the same restore procedure from a VM backup. To learn more, see the Restore to Microsoft Azure section in the Veeam Backup & Replication User Guide.

**IMPORTANT!**

If the disk you want to restore contains an LVM volume group, Veeam Agent will restore the original disk and the LVM volume group as 2 separate disks. As a result, required storage space will increase. For example, you restore a machine with 2 disks, and a separate LVM volume group is configured on each of these disks. In this case, Veeam Agent will restore 4 disks. The restored disks will consume storage space equal to the size of 2 original disks and 2 LVM volume groups from these disks.
Restoring to Amazon EC2

You can restore Linux machines from Veeam Agent backups to Amazon EC2. Backups must be created at the entire machine level or volume level.

The procedure of restore to Amazon EC2 from a Veeam Agent backup practically is similar to the same restore procedure from a VM backup. To learn more, see the Restore to Amazon EC2 section in the Veeam Backup & Replication User Guide.

IMPORTANT!

If the disk you want to restore contains an LVM volume group, Veeam Agent will restore the original disk and the LVM volume group as 2 separate disks. As a result, required storage space will increase. For example, you restore a machine with 2 disks, and a separate LVM volume group is configured on each of these disks. In this case, Veeam Agent will restore 4 disks. The restored disks will consume storage space equal to the size of 2 original disks and 2 LVM volume groups from these disks.
Performing Administration Tasks

You can manage Veeam Agent backup jobs and backups created with these jobs. Veeam Backup & Replication allows you to perform the following administration tasks:

- Import Veeam Agent backups
- Enable and disable Veeam Agent backup jobs
- Remove Veeam Agent backup jobs
- View Veeam Agent backup job statistics
- Remove Veeam Agent backups
- View Veeam Agent backup properties
- Configure global settings
- Assign roles to users
Importing Veeam Agent Backups

You may need to import a Veeam Agent backup in the Veeam Backup & Replication console in the following situations:

- The Veeam Agent backup is stored on a drive managed by another computer (not the Veeam backup server).
- The Veeam Agent backup is stored on a backup repository managed by another Veeam backup server.
- The Veeam Agent backup has been removed in the Veeam Backup & Replication console.

After importing, the Veeam Agent backup becomes available in the Veeam Backup & Replication console. You can restore data from such backup in a regular manner.

Before importing a backup, check the following prerequisites:

- The computer or server from which you plan to import the backup must be added to Veeam Backup & Replication. Otherwise you will not be able to access backup files.
- To be able to restore data from previous backup restore points, make sure that you have all incremental restore points in the same folder where the full backup file resides.

To import a Veeam Agent backup:

1. In Veeam Backup & Replication, click **Import Backup** on the **Home** tab.
2. From the **Computer** list, select the computer or server on which the backup you want to import is stored.
3. Click **Browse** and select the necessary VBM or VBK file. If you select the VBM file, the import process will be notably faster. It is recommended that you use the VBK files for import only if a corresponding VBM file is not available.
4. Click **OK**. The imported backup will become available in the **Home** view, under the **Backups > Disk (imported)** node in the inventory pane.
Importing Encrypted Backups

You can import Veeam Agent backups that were encrypted by Veeam Backup & Replication or Veeam Agent for Linux.

To import an encrypted backup file:

1. On the Home tab, click Import Backup.
2. From the Computer list, select the host on which the backup you want to import is stored.
3. Click Browse and select the VBM or VBK file.
4. Click OK. The encrypted backup will appear under the Backups > Disk (encrypted) node in the inventory pane.
5. In the working area, select the imported backup and click Specify Password on the ribbon or right-click the backup and select Specify password.
6. In the Password field, enter the password for the backup file. If you changed the password one or several times while the backup chain was created, you need to specify the latest password. For Veeam Agent backups, you can use the latest password to restore data form all restore points in the backup chain, including those restore points that were encrypted with an old password.

If you enter correct password, Veeam Backup & Replication will decrypt the backup file. The backup will be moved under the Backups > Disk (imported) node in the inventory pane.
Enabling and Disabling Veeam Agent Backup Jobs

You can disable and enable Veeam Agent backup jobs in Veeam Backup & Replication.

When you disable the job, you prohibit the user to store the resulting backup to the backup repository. If the user starts a disabled job manually or the job starts by schedule, the job session will fail and report the "Job is disabled on backup server" error. To let Veeam Agent store backups to the backup repository again, you must enable the disabled job.

To disable or enable the scheduled backup job in Veeam Backup & Replication:

1. In Veeam Backup & Replication, open the Home view.
2. In the inventory pane, click the Jobs node.
3. Select the necessary job in the working area and click Disable on the ribbon or right-click the necessary job in the working area and select Disable. To enable the disabled job, click Disable on the toolbar or right-click the job and select Disable once again.
Deleting Veeam Agent Backup Jobs

You can delete Veeam Agent backup jobs.

When you delete a Veeam Agent backup job, Veeam Backup & Replication removes all records about the job from its database and console. When the user starts a new Veeam Agent backup job session manually or the job starts automatically by schedule, the job will appear in the Veeam Backup & Replication console again, and records about a new job session will be stored to the Veeam Backup & Replication database. To remove the job permanently, you must delete the job and unassign access rights permissions for this user from the backup repository.

To remove a job:

1. In Veeam Backup & Replication, open the **Home** view.
2. In the inventory pane, click the **Jobs** node.
3. Select the necessary job in the working area and click **Delete** on the toolbar or right-click the necessary job in the working area and select **Delete**.
Viewing Veeam Agent Backup Job Statistics

You can view statistics about Veeam Agent backup jobs in the Veeam Backup & Replication console. Veeam Backup & Replication displays statistics for Veeam Agent backup jobs in the similar way as for regular backup jobs. The difference is that the list of objects included in the job contains a Veeam Agent machine instead of one or several VMs.

To view Veeam Agent backup job statistics:

1. In Veeam Backup & Replication, open the **Home** view.
2. In the inventory pane, click the **Jobs** node.
3. In the working area, select the necessary Veeam Agent backup job and click **Statistics** on the ribbon or right-click the job and select **Statistics**.
Removing Veeam Agent Backups

You can remove Veeam Agent backups from Veeam Backup & Replication or permanently delete Veeam Agent backups from the Veeam backup repository.

Removing from Configuration

When you remove a Veeam Agent backup from configuration, Veeam Backup & Replication deletes all records about the backup from its database and console. The actual backup files remain on the backup repository. You can import the backup to the Veeam Backup & Replication at any time later and restore data from it. To learn more, see Importing Veeam Agent for Linux Backups.

To remove a Veeam Agent backup from configuration:

1. In Veeam Backup & Replication, open the Home view.
2. In the inventory pane, click Disk under the Backups node.
3. In the working area, expand the Agents node, select the necessary backup and click Remove from > Configuration on the toolbar or right-click the backup and select Remove from configuration.

Removing from Veeam Backup Repository

When you remove a Veeam Agent backup from the Veeam backup repository, Veeam Backup & Replication deletes all records about the backup from its database and console. The actual backup files are removed from the backup repository, too.

To remove a Veeam Agent backup from the backup repository:

1. In Veeam Backup & Replication, open the Home view.
2. In the inventory pane, click Disk under the Backups node.
3. In the working area, expand the **Agents** node, select the necessary backup and click **Remove from > Disk** on the toolbar or right-click the backup and select **Delete from disk**.
**Viewing Veeam Agent Backup Properties**

You can view statistics about Veeam Agent backups.

To view Veeam Agent backup statistics:

1. In Veeam Backup & Replication, open the **Home** view.
2. In the inventory pane, click **Disk** under the **Backups** node.
3. In the working area, expand the **Agents** node, select the necessary backup and click **Properties** on the toolbar or right-click the backup and select **Properties**.
Configuring Global Settings

Global settings configured on the Veeam backup server apply to Veeam Agent backup jobs as well. You can:

- Configure network throttling settings so that Veeam Agent backup job does not consume all network resources.
- Configure global email settings to get alerted about the Veeam Agent backup job results.

To learn more, see Veeam Backup & Replication Documentation.
Assigning Roles to Users

User roles configured on the Veeam backup server apply to Veeam Agent backup jobs as well. To learn more, see the Roles and Users section in the Veeam Backup & Replication User Guide.
