

Long-term Data Protection & Recovery – ExaGrid & Veeam

Powerful, scalable long-term retention with ExaGrid Tiered Backup Storage

ExaGrid Tiered Backup Storage and Veeam® Availability Suite™ provide an industry-leading solution that's specifically built for virtual environments. Together, ExaGrid and Veeam provide scalable and cost-effective backup that goes beyond standard disk-based data protection to enable businesses to achieve the performance and efficiency needed to realize their backup, recovery and disaster recovery goals.

Reduce long-term retention costs

As the size and volume of data increase exponentially, the need to control data storage costs becomes more and more important. Veeam integration with ExaGrid reduces complexity and scales as data grows to ensure backup and recovery goals continue to be achieved.

Data security and ransomware prevention

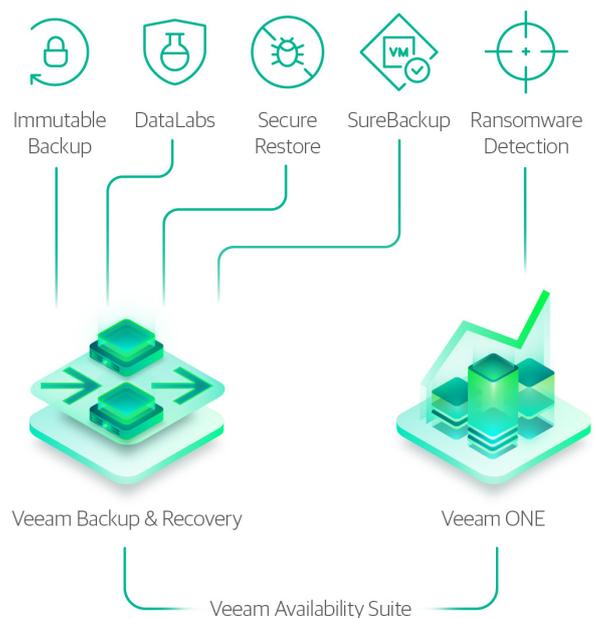

Ransomware can inflict significant damage and expenses upon business, quickly paralyzing the entire organization. ExaGrid and Veeam offer immutable storage options to protect your cloud, Software as a Service (SaaS), virtual and physical workloads from ransomware.

Protect backup data from attack: Prevent restore points from deletion with ExaGrid Retention Time-Lock for Ransomware Recovery and create air-gapped or “immutable” backups with Veeam using Amazon Web Services (AWS) Amazon Simple Storage Service (S3) or select S3-compatible storage.

Detect ransomware: Monitor your environment closely and be aware of any suspicious or abnormal activity with Veeam ONE™ possible ransomware activity alarm.

Ensure ransomware-free backups: Having a backup to restore from, especially after a ransomware attack, is essential and Veeam SureBackup® can scan your Veeam backups for malware and verify recoverability.

Restore workloads virus-free: Scan your backups for viruses when restoring to safeguard against previously unknown viruses and increase confidence that dormant threats won't be reintroduced back into the environment with Secure Restore.

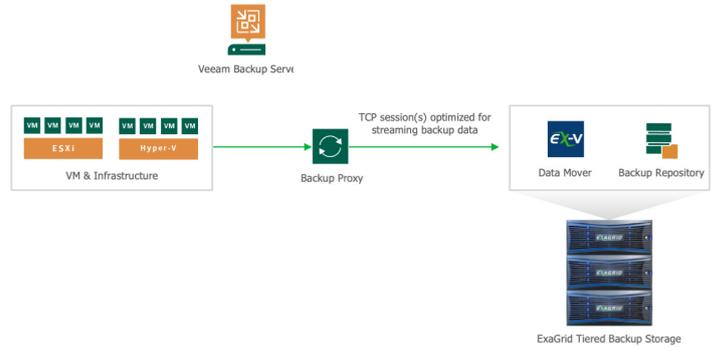

Fast backup and recovery

Veeam writes directly to the ExaGrid Landing Zone for the fastest backups. As a result, recent backups remain in a non-deduplicated form, resulting in rapid restores while avoiding lengthy data rehydration processes. Veeam customers can even leverage Instant VM Recovery® to run workloads directly from the ExaGrid appliance until the primary storage device becomes available.

Faster backups and data processing: Compared to standard deduplication appliances.

Quicker backups: Faster synthetic full backups due to integration with the Veeam Data Mover and support for Veeam Instant VM Recovery.

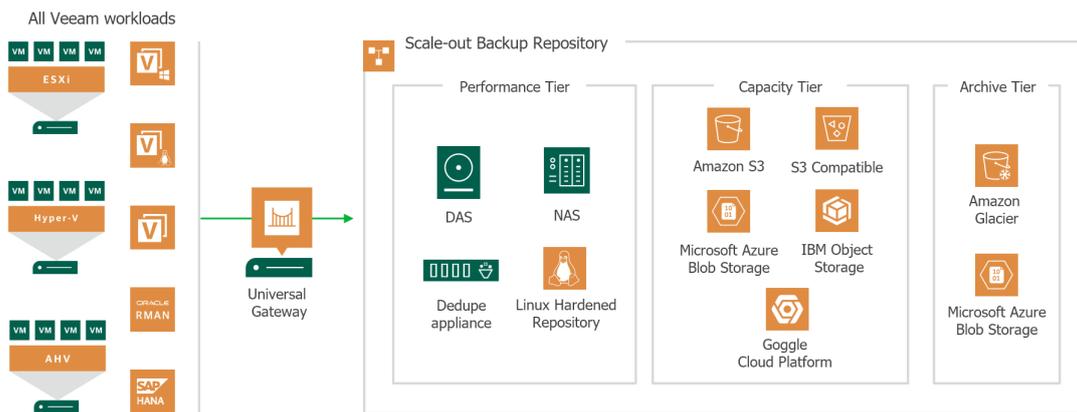

Scalable and cloud ready

Scale out as needed to manage data growth and sprawl with ExaGrid and Veeam. Simply add additional ExaGrid Tiered Backup Storage appliances to the system to add capacity or direct all backup jobs to a single Veeam Scale-Out Backup Repository™ (SOBR) and multiple ExaGrid appliances.

Move inactive backup chains to Veeam Capacity Tier and store data at several sites without increasing complexity.

S3-compatible object storage support from Veeam so you can expand to the cloud, including Amazon S3, Microsoft Azure Blob Storage, Microsoft Azure Data Box, IBM Cloud Object Storage, Google Cloud Object Storage and more!

ExaGrid and Veeam – Better Together

ExaGrid Tiered Backup Storage appliances and Veeam Availability Suite provide an industry-leading solution that's specifically built for virtual environments.

Together, ExaGrid and Veeam provide scalable and cost-effective backup solutions that go beyond standard disk-based data protection to enable businesses to achieve the performance and efficiency needed to realize their backup, recovery and disaster recovery (DR) goals.
